THE SOCIETY OF CHEMICAL INDUSTRY

LIST OF PAPERS PRESENTED TO THE SOCIETY & PUBLISHED IN THE TRANSACTIONS DURING 1920

N.B.—The words within ( ) indicate the Section or Group of the Society (if any) before which the paper was read and the issue of the Journal in which it appears.

PAGE

Ada, M. Determination of minute quantities of petroleum spirit in vegetable oils (June 15) . . 152T

Allott, E. A. Recessed plate and plate and frame filter-presses: their construction and use. (Annual Meeting, Aug. 31) 261T

Andrews, A. C. P. *See* Read, J. . 285T

Antilogoff, N. A. The handling of petroleum in bulk at Thames Haven. (Chemical Engineering Group, May 31) . 138T

Ardern, E. The activated sludge process of sewage purification: large scale operation (Manchester, Mar. 15) . . . 60T

Armstrong, E. F., and T. P. Hilditch. Catalytic actions at solid surfaces: some factors controlling the rate of hydrogenation of ethylenic compounds in presence of nickel. (Liverpool, May 15) . . 120T

Atkin, W. R., and W. E. Palmer. Determination of alkalinity in tannery lime liquors. (Yorkshire, May 31) 145T

Atkinson, H. M. Air-oven thermo-regulator (Aug. 31) 298T

Bailey, G. H. The rate of corrosion of aluminium (Edinburgh, May 15) . . 118T

Barker, M. F. *See* Fox, J. J. . . 169T

Barrett, E. L. A new test for detection of lignoous impurities in cotton and cotton waste for nitration purposes (Mar. 31) . 81T

Bhatnagar, S. S., and W. E. Garner. The effect of addition of certain fatty acids on the interfacial tension between B.P. paraffin oil and mercury. (July 15) . . 185T

Bostock, B. R. *See* Knecht, E. . . 163T

Bramwell, B. Design of mechanical filters. (Annual Meeting, July 31). . . 232T

Brazier, S. A. *See* Twiss, D. F. . . 125T, 155T

Brenchley, W. E., and E. H. Richards. The fertilising value of sewage sludges. (London, July 15) 177T

Brockbank, C. J. Manufacture of artificial abrasives in the electric furnace. (Birmingham, Feb. 28) 41T

Brown, J. C. Notes on tungsten ore deposits in Burma. (Newcastle, Feb. 28) . . 44T

PAGE

Butler, G. S., and H. B. Dunnicliff. The estimation of alcohol in mixtures of alcohol, sulphuric acid, and water. (May 31) . . 146T

Callan, T., J. A. R. Henderson, and N. Strafford. The estimation of the nitro group in aromatic organic compounds. (Manchester, Apr. 15) 86T

Campbell, D. F. Recent developments of the electric furnace in Great Britain. (Annual Meeting, July 31) 224T

Challenger, F. *See* Frankland, P. F. 256T, 313T

Clulow, F. S., and C. W. Taylor. The consistency of greases. (Aug. 31) 291T

Collins, S. H., and A. Spiller. Sugar in oat straw and cattle foods. (Mar. 15) . . 66T

Erratum 82T

Colman, H. G. The estimation of paraffins in commercial toluol. (Feb. 28) 50T

Crow, H. W. Method of transporting and distributing liquids about a factory. (Chemical Engineering Group, May 31) . . 144T

Curtis, R., and F. D. Miles. The "heat-rise" method of testing sulphuric acid and oleum. (Mar. 15) 64T

Dawson, H. M. Some observations on the "springing" of "carbolate," and the recovery of phenol from the resulting aqueous liquor. (Yorkshire, June 15) 151T

Desch, C. H. Some properties of 60 : 40 brass. (Annual Meeting, July 31). 216T

De Vries, O. The "slope" or "type" of the rubber stress-strain curve. (Sept. 30) . . 308T

De Waele, A. Consideration of some factors affecting the oxygen-absorption of linseed oil. (Feb. 28) 48T

Donnan, F. G., and I. Masson. The theory of gas scrubbing towers with internal packing. (London, July 31) 236T

Dunnicliff, H. B. *See* Butler, G. S. . . . 146T

Edwards, K. B., and G. A. Freak. Notes on the United States Government method of determining phenols in sheep dips. (Dec. 15) 326T

Faber, H. B. Industrial filtration. (American, Feb. 16) 21T

PAGE

Fawsitt, C. E. The action of concentrated sulphuric acid on iron. Part III. (May 31) 147T

Fox, J. J., and M. F. Barker. The analysis and composition of cresylic acid. (June 30) 169T

and A. J. H. Gauge. Note on the determination of tar acids in drainage from tarred roads. (Aug. 16) 260T

Fowles, S. H. *See* Howson, G. W. 211T

Frankland, P. F., and F. H. Garner. The preparation of picryl chloride by nitration of 1-chloro-2.4-dinitrobenzene. (London, Aug 16) 257T

F. Challenger, and D. Webster. The preparation of thiocarbonyl tetrachloride (London, Aug. 16) 256T

F. H. Garner, F. Challenger, and D. Webster. The preparation of thiophosgene from thiocarbonyl tetrachloride. (Oct 30) . 313T

Freak, G. A. *See* Edwards, K. B . 326T

Garner, F. H. *See* Frankland, P. F . 257T, 313T

Garner, W. E. A metal glass tap (Dec 31) . 347T

See Bhatnagar, S. S 185T

Gauge, A. J. H. *See* Fox, J. J. . . 260T

Gee, W. J. A new process of centrifugal filtration. (Annual Meeting, Aug. 16) .. 255T

Ghose, T. P. *See* Simonsen, J. L . 296T

Gibson, W. H., and R. McCall. The viscosity of solutions of nitrocellulose in ether-alcohol. (June 30) . 172T

Green, S. J. *See* Price, T. S . . 98T

Grounds, A. *See* Sinnatt, F. S .. 83T

Haddon, C. L. The setting of calcium sulphate cements (Newcastle, June 30) . 165T

Hall, E. H. The estimation of nickel in steels by direct titration (July 31) . 253T

Hall, G. F. *See* Richmond, H. D . 80T

Hatschek, E. The principles of technical filtration. (Annual Meeting, July 31) 226T

Hayhurst, W. Pumping acids or other corrosive liquids, with particular reference to the armoured "Cerathermic" centrifugal pump. (Chemical Engineering Group, May 31) 145T

Hemmings, F. C. *See* Lowry, T. M . 101T

Henderson, J. A. R. *See* Callan, T . 86T

Henning, A. Technical applications of ethyl chloride. (London, Jan 15) . 1T

Hewson, G. W., and S. H. Fowles. The more economical utilisation of coke oven and blast furnace gases for heating and power (Annual Meeting, July 31) 211T

Hilditch, T. P. *See* Armstrong, E. F. 120T

Hornby, A. J. W. Pectins in various plants (Newcastle, July 31) 240T

Howarth, G. B. A graphical method for the interpretation of flue gas analyses (Yorkshire, Dec. 31) 329T

Howson, C. W. H. *See* Twiss, D. F . .. 287T

Illingworth, S. R. Researches on coal. Part I. The thermal decomposition of coal at low temperatures. Part II. An investigation of certain coking coals: a theory of coking (Bristol, May 18 and 31) .. 111T, 134T

Imison, M. *See* Wilson, L. P 322T

Jones, D. W. Chemical sheet lead. (Annual Meeting, July 31 and Aug. 16) .. 221T, 255T
Errata 256T

PAGE

Jones, W. J. *See* Sanderson, W. J. 8T

Joseph, A. F. Change of refractive indices of fixed oils with temperature. (Mar. 15) .. 66T

and F. J. Martin. A note on an explosion during the separation of potassium by the perchlorate method. (Apr. 15) 94T

A preliminary account of the chemistry of the Nile sudd. (Apr. 15) 91T

Knapp, A. W. *See* Liversegge, J. F .. 27T

Knecht, E., and B. R. Bostock. The neutral hydrolysis of guncotton, with a note on the alkaline hydrolysis of guncotton. (Manchester, June 30) 163T

Lane, K. W., and O. F. Lubatti. A rapid method of estimating water in crude camphor. (Feb. 28) . . 50T

Lantsberry, F. C. A. H., and R. A. Page. The solidification points of mixtures of metallic chlorides (Birmingham, Feb 28) .. 37T

Levinstein, H. The dyestuff industry (London, Dec 15) 317T

Lewis, E. The estimation of paraffins in commercial toluol (Feb 28) . . 50T

Liversegge, J. F., and A. W. Knapp. The action of water on lead (Birmingham, Feb 16) .. . 27T

Lowry, T. M., and F. C. Hemmings. The properties of powders. Part I. The caking of salts. (London, Apr 30) 101T

and S. Wilding. A note on the setting of dental cements (London, Apr 30) . 110T

Lubatti, O. F. A rapid method of estimating lead in cassia oil (Feb 16) 35T

See Lane, K. W 50T

McCall, R. *See* Gibson, W. H 172T

Marshall, A. The determination of hollow charges (Feb 16) 35T

Martin, F. J. The distribution of enzymes and proteins in the endosperm of the wheat berry (Dec 15 and 31) 327T, 348T

The properties affecting strength in aeration flour (July 31) . 240T

See Joseph, A. F 91T, 94T

Mastbaum, S. Distillation plant, with special reference to the rectification of alcohol, acetaldehyde, and other volatile products and continuous ether manufacturing plant (Manchester, Sept 15) . 299T

Masson, I. *See* Donnan, F. G 236T

Maxted, E. B. Catalysis from an industrial standpoint (Birmingham, Apr 30) 90T

Menzies, S. H. The Sharples super centrifuge (Annual Meeting, July 31) 241T

Miles, F. D. *See* Cohen, B 64T

Moore, B. *See* Sinnatt, F. S 72T

Moore, H. A new instrument for measuring vapour tension. (Manchester, Mar. 31) 78T

Morrell, R. S. Catalysis applied to the oxidation of oils (Birmingham, June 30) . 153T

Musgrave, A. E. Sodium peroxide fusions (Nottingham, Mar. 31) . 80T

Myers, J. E., and H. Stephen. Synthesis of $\beta\beta'$-dichlorodiethyl sulphide (mustard gas). (Mar. 15) 65T

Nuttall, W. H. Wetting power and its relation to industry. (Glasgow, Mar. 31) 67T

PAGE

Ormandy, W. R. The filtration of colloids. (Annual Meeting, July 31).. .. .. 228T

O'Sullivan, J. The influence of temperature, concentration, duration of the mash, and slackness of the malt on the starch products of the extract of malt (Birmingham, Feb. 16) 22T

Page, R A. *See* Lantsberry, F C A. H. . 37T

Palmer, W. E *See* Atkin, W. R 145T

Palmer, W. G A laboratory apparatus for preparing electrolytic hydrogen (Oct 30) 316T

Pelmore, R A. The Axamore "squeegee" pump (Chemical Engineering Group, May 31) 141T

Pickering, G F. The commercial examination of sulphonated oils (Yorkshire, Sept 15) 305T

Price, T S, and S J. Green The preparation of cyanogen chloride on a large laboratory scale. (Birmingham, Apr 30) 98T

Prideaux, E B R The deliquescence and drying of ammonium and alkali nitrates and a theory of the absorption of water vapour by mixed salts (Nottingham, July 15) . . . 182T

Procter, R A Cotton cellulose The application to industry of recent researches on its viscosity (Dec 31) 335T

Read, J, and V C P Andreas Note on a Papuan natural petroleum Part II (Aug 31) 289T

Reavell, J A The elevation of acids by the Kestner patent automatic elevator (Chemical Engineering Group, May 31) 142T

Rees, W J The corrosion of coke oven walls (Annual Meeting, July 31) 197T

Renwick, F F Photographic images visible and invisible (Hunter Memorial Lecture) (Liverpool, June 30) 156T

Richards, E H *See* Brenchley, W E . 177T

Richmond, H D, and G F Hall Note on the Reichert Meissl-Polenske method (Nottingham, May 31) . . 80T

Rogers, A Industrial uses for the bark and porpoise (American Jan 31) 9T

Rosenblum, F I Note on the determination of diastatic activity (Oct 30) 311T

Rowe, F M Hydrogenation of the naphthalene series (Manchester, July 31) 241T

Salway, A H A contribution to the theory of polymerisation in fatty oil (Dec 15) 324T

Sanderson, W J, and W J Jones The estimation of arsenic in commercial arsenic (Jan 15) . 8T

Schwers, F The vapour pressure of arsenious oxide in sulphuric acid solutions (Feb 16) 33T

Sen Gupta, N N A study of the fruit of *Sebastiana trapica*, with special reference to the generation of hydrocyanic acid in the seed (Newcastle, Apr 15) 88T

Silvester, W A The rectified petroleum spirit from the tolmen petrol fraction of Borneo petroleum, with a note on laboratory fractionating columns (July 15) . 187T

Simonsen, J L, and T. P Ghose The distillation of camphor in India. (Aug 31) 296T

Sinnatt, F S., and A Grounds A new characteristic for coal: the agglutinating power curve. (Manchester, Apr. 15) 83T

PAGE

Sinnatt, F. S., and B. Moore. A method of determining the relative temperatures of spontaneous ignition of solid fuels. (Manchester, Mar. 31) 72T

Slator, A. The estimation of carbon dioxide and fermentable sugars. (Birmingham, June 15) 149T

Smith, E W By products from coke-ovens. (Annual Meeting, July 31).. .. .. 194T

Errata 255T

Southcombe, J E *See* Wells, H. M. .. 51T

Speedy, A The softening of plastic materials determined by the Widney resilometer and expressed graphically. (Jan 31) .. 18T

Erratum 36T

Spiller, A. *See* Collins, S H 66T

Stephen, H *See* Myers, J E. .. . 65T

Stevens, H P The preservation of vulcanised rubber (July 31) 251T

Stewart R A. The Mercken pump (Chemical Engineering Group, May 31) .. . 141T

Stewart, S The detection of natural barytes in lithopone etc (July 15) 188T

Stafford, N. *See* Cullan, T . 86T

Sturgeon, R A The "Sturgeon" self-discharging centrifuges for separating solids from liquids (Annual Meeting, July 31) 230T

Taylor, C W *See* Chilow, F S 291T

Thomas, R The mechanism of the addition of hydrogen to unsaturated glycerides in the presence of finely-divided nickel. (Liverpool, Jan 31) 10T

Tims, F. H. The use of the refractometer in ascertaining the purity of certain refined edible oils (Sept 30) 307T

Tungay, S J. Centrifugal pumps for sulphuric and nitric acids (Chemical Engineering Group, May 31) 143T

Twiss, D F, and S A Brazier The acceleration of vulcanisation. (May 15 and June 30) 125T, 155T

and C W. H Howson The acceleration of vulcanisation Part II (Aug 31) .. 287T

Ward, W A Modern by product coke-oven construction (Annual Meeting, July 31) 198T

Webster, D *See* Frankland, P F. .. 256T, 313T

Wells, H. M, and J E Southcombe The theory and practice of lubrication: the "germ" process (London, Mar. 15) .. 51T

West, J H. General types of pumping machinery for chemical works. (Chemical Engineering Group, May 31) 139T

Weyman, G. A comparative method of determining the heat of carbonisation of coal. (Newcastle, June 30) 168T

Wilding, S *See* Lowry, T. M 110T

Williams, A M The depolarisation by oxygen of a voltaic cell. (Edinburgh, Aug 31) .. 285T

Wilson, L P. Catalytic action in the oxidation of cellulose. (Birmingham, July 15) .. 177T

and M Imuson. The dyeing of artificial silk. (Dec 15) 322T

Wright, H. E. Coke-oven gas for town supply. (Annual Meeting, July 31). 214T

Young, W Calculations involved in the preparation of acid mixtures used in the manufacture of nitrocotton. (Oct. 30) .. 315T

Journal of the Society of Chemical Industry
Vol. XXXIX. 1920

Name Index

N.B.—The Review, Transactions, and Abstracts Sections of the Journal are paged separately and are indicated by the letters R, T, *and* A *respectively following the number of the page.*

The letter (P) *indicates that the matter referred to is a patent.*

An asterisk appended to the number of a page indicates that the title only of an article is given, or in the case of patents, either the title only or the title and a reference to a previous patent.

The titles of new books are given within quotation marks.

fatty; Turbidity temperature of —— Parker .. 145R
fatty; Volatility with steam of lower —— in dilute aqueous solution Witzemann .. 134A
Formation of —— by moulds and yeasts Boas and Lebrle .. 168A
Iodometric estimation of —— Kolthoff .. 175A
Manufacture of —— (P) Chaplin .. 189A
organic, Apparatus for electrolytic decomposition of —— at low temperature and with small volumes of liquid Henrich and Schenk .. 162A
organic, Catalytic preparation of —— from nitriles. Mailhe .. 610A
organic, Dissociation constants of —— as means for their identification Kolthoff .. 703A
organic; Extraction of —— from wood-, lignite-, or peat-tar (P) Börnstein .. 359A
organic; Extraction of —— from wood tar. (P) Börnstein .. 57A
organic; Identification of —— as *p*-halogenphenacyl esters Judefind and Reid .. 501A
organic; Identification of —— by phenacyl bromide; injurious action of latter on the skin Cox .. 832A
organic, Manufacture of —— (P) Moest and others 501A
organic; Manufacture of water-soluble alkaline-earth salts of ——. (P) Herrfeld and Lénart .. 467A
organic; Rapid volumetric determination of ——. Foreman .. 613A
Pumping ——, with particular reference to the armoured Weatherm centrifugal pump Haythurst .. 145T
Simultaneous conductometric titration of different —— Kolthoff .. 530A
Sterilising power of —— Anbel .. 424A
Titration of mixed —— by conductivity methods. Kolthoff .. 316A
Titration of —— using surface-active higher fatty acids as indicators Windisch and Dietrich .. 138A
volatile, Determination of —— in fermentation products Hinard .. 669A
volatile fatty; Influence of electrolytic dissociation on distillation in steam of ——. Reilly and Hickinbottom .. 768A
waste; Apparatus for recovery of nitric and sulphuric acids from ——. (P) Baer .. 748A
waste; Recovery of —— from mineral oil refining. Kolbe .. 438A
weak; Titration of —— with weak bases. Kolthoff .. 706A

Acrolein; Preparation of ——. Moureu and Lepape .. 42A
Reaction of ——. Tsakalotanis .. 425A
Stabilisation of ——. Moureu and Lepape .. 42A
Stabilisation of ——. Compounds acting as stabilisers against formation of dimeryl (insoluble resin). Moureu and others .. 82A

Acrolein—*continued*.
Stabilising action on —— of substances with a phenolic group. Moureu and others 173A
Actinometers and the like. (P) Hargreaves 471A
Adhesive compositions, especially for waterproofing fabrics and rendering them impermeable to gases. (P) Soc. Anon. Etabl. Hutchinson 482A
compositions; Improving ——. (P) Sarason 309A
compositions; Manufacture of ——. (P) Alexander .. 795A
pastes; Manufacture of ——. (P) Veredelungsges. f. Nahrungs- u. Futtermittel 275A
Adhesives for articles made of cellulose derivatives. (P) Bayer und Co. 361A, 719A
Manufacture of ——:
(P) O'Gorman and Schryver 419A
(P) Wallasch 759A
Manufacture of —— from cellulose waste lyes. (P) Claass 719A
Manufacture of flexible —— unaffected by hot water. (P) Hoffmann 460A
Manufacture of —— from lignite. (P) Gerdes .. 759A
Manufacture of —— from starch. (P) Bloede .. 202A
Manufacture of —— from sulphite-cellulose waste lyes (P) Huttenes 309A
Adipic acid esters; Manufacture of ——. (P) Bayer und Co. 427A
Adrenaline; Colorimetric determination of ——. Scoville 673A
Manufacture of ——. (P) Nagai 43A
Adsorbed substances; Separation of ——. (P) Schwerin, and Ges. für Elektro-Osmose .. .. .. 145A•
Adsorbing materials; Density of various ——. McLean .. 540A
Adsorption. Berczeller .. .. 189A•
Emulsification by —— at a nitrobenzene-water interface. Sheppard 100A
of gases by carbonised lignite McLean .. 543A
of gases by charcoal; Effect of pressure on ——. Pickles 543A
Reactivity and —— in heterogeneous catalysis Rideal 91A
of surface-active substances by various adsorbents Michaelis and Rona 205A
of vapours on charcoal; Heat of ——. Lamb and Coolidge 557A
Aerating sewage and other foul liquids. Apparatus for —— (P) Ames 525A
sewage and other impure liquids (P) Stott and Jones 557A•
Aeroplane propellers; Fabric coated with "bakelite" for —— 338R
Aeroplanes; Flexible fireproof material for ——. (P) Feary 686A
Material and dopes for planes of —— Fuchs .. 292A
Africa. Phosphate production in French North —— .. 438R
Agar. Action of radium radiation on —— Fernau .. 554A
gels containing silver nitrate, Penetration of sodium chloride into —— Stiles 274A
Ageing machines. (P) Calico Printers' Assoc., and others 154A
Agitating apparatus; Decanting and ——. (P) Pettis .. 564A•
liquid or semi-liquid materials, Apparatus for mixing, circulating and ——. (P) Coles, and Allen and Co. 144A
liquids by means of a magnetic field (P) Meyer .. 394A
and or mixing machines (P) Brinjes and Goodwin, Ltd., and Harris 564A
Agitators (P) Savre 256A
Agricultural Journal of Union of South Africa; Re-appearance of — 219R
Air analysis apparatus; Improvement in the Haldane general —— Frederick 836A
Apparatus for filtering or otherwise treating ——. (P) Heenan and Froude, Ltd., and Cruyt 1A
Apparatus for liquefying —— (P) Place .. 335A•
Apparatus for producing hot —— (P) Pederson 437A•
Apparatus for producing hot —— for drying and other purposes (P) Schlatter, Frorath, and Co .. 1A
Apparatus for separating condensable vapours from ——. (P) Fries Sohn 437A
Apparatus for subjecting —— to the action of liquid in the form of spray (P) Fowler 475A
Apparatus for supplying heated —— to furnaces (P) Owen 682A
Apparatus for treating —— (P) Yardley .. .. 544A•
Apparatus for treating and cooling —— (P) Heenan and Froude, Ltd., and Cruyt 1A
Apparatus for treating —— with liquids or rice *retard*. (P) Bulgin and others 475A, 739A
Compressing ——. (P) Melms u. Pfenninger Kommanditges., and Gensheimer 53A
Continuous production of pure germ free ——. (P) Wolff 500A
Desiccating ——. (P) Claude, and L'Air Liquide .. 544A•
dryer. (P) Macfadden 52A
Drying —— for blast furnaces. (P) Mackay 160A
Electric arc treatment of ——. (P) Friedrich .. 755A
Electrical purification of ——. D'Arsonval and others 347A
employed for carrying off particles from machinery or processes in which they are produced or given off; Apparatus for separating solid matter from ——. (P) Robinson and Son, Ltd., and others .. .. 649A•
enriched in oxygen; Future of use of —— in metallurgy. Cottrell 321R
filters; Bag cleaning devices for ——. (P) Beth .. 92A
Fractionating ——. (P) General Electric Co. .. 449A
-lift system for raising oil. Stirling 182R

liquid; Production and use of —— for blasting. Diederichs 315A
liquid; Rectification of ——:
Barbet 668A
(P) Barbet et Fils et Cie. 489A
liquid; Vessels for transport and handling of ——. Moser 51A
-ovens; Thermo-regulator for ——. Atkinson .. 298T
pollution by smoke; Effects of —— and its prevention. Cohen 284R
Purification of ——. (P) Everitt 563A
Purification of expired ——. (P) Speter 761A
Separating —— into its constituents. (P) Ges. f. Linde's Eismaschinen A.-G. .. .. 545A, 597A•
Separation of —— into oxygen and nitrogen. Norton 721A
supply for blast-furnaces, Heating the ——. (P) Comp. des Forges et Aciéries de la Marine et d'Homécourt 238A
Vitiation of —— by storage of tobacco and other vegetable substances. Frederick 799A
Aircraft; Fireproofing for ——. (P) Bradley, and Aircraft Fireproofing Corporation .. .. .. 13A, 757A•
Manufacture of fabrics for ——:
(P) Feary .. .. 186A•
(P) Sage and Co., and Feary 13A
Alaska; Mineral output of —— in 1919 .. .. .. 113R
Alberta. *See under* Canada
Albumin; Acid- ——. Adolf and Spiegel 702A
Manufacture of a colloidal solution, neutral to the taste, from vegetable ——. (P) N. V. Jurgens Vereenigde Fabr 204A
Albumins; Behaviour of —— towards the electric current, and isolation of pure antitoxic albumin from diphtheric serum by electro-osmosis. Ruppel .. 557A
Albumoses; Histamine and a histamine-like substance as decomposition products of ——. Nagayama .. 673A
Alcohol, absolute, Manufacture of ——. (P) Frankforter 701A
absorbed in sulphuric acid; Recovery of ——. (P) Herrmann 765A
and aniline; Catalysts which promote reaction between —— Johnson and others 594A
from coke-oven gas 308R
Combustible mass of kieselguhr soaked with ——. (P) Von Schütz 358A
Dehydrogenation of ethyl —— in presence of finely-divided metals Armstrong and Hilditch 466A
denaturants Dobbie 86R
denatured, Detection of —— in spirits Hasse .. 796A
denatured, Manufacture of ——. (P) Pascal 426A
Denatured —— in U.S.A. 337R
Denaturing —— at the distilleries in Canada 379R
and its derivatives, Fixation of ethylene present in coke-oven gas as —— Bury 94A
Detection of water in ——. Henle 501A
Determination of —— in beverages and the like. (P) Dehn 352A
Determination of composition of mixtures of water and —by electrical conductivity measurements. Kolthoff 203A
Determination of —— in mixtures of alcohol, sulphuric acid, and water Butler and Dunnicliff 146T
Differentiation of methyl alcohol and ethyl ——:
Pannwitz 38A
Sabalitschka 245A
Distillation of mixtures of water and ——. Masfaraud 300T
Distillation plant with special reference to rectification of ——. Masfaraud 299T
Extracting —— from liquids. (P) Fehr 732A
Industrial —— Desborough 302R
industry in Japan, Development of the —— 289R
Ignition of mixtures of air, acetone or ether, and —— in contact with heated surfaces. White and Price .. 95A
Loss of —— during fermentation. Harder 203A
Losses of —— in distilleries, and methods of recovery. Mariller 670A
Manufacture of —— (P) Elektrizitätswerk Lonza .. 135A
Manufacture of —— from coal distillation gases. De Loisy 147A
Manufacture of de-alcoholised beverages and —— from fermented liquors. (P) Schneible .. .. .. 310A•
Manufacture of —— from ethylene. (P) Damiens and others 833A
manufacture. Influence of design of digester fittings on quantity of waste liquor for ——. Kuhn 228A
Manufacture of —— from Jerusalem artichokes:
Rudiger 608A
Windisch 760A
Manufacture of —— and of other products from reeds. (P) Verwertung inländischer Produkte Ges. .. 185A
Manufacture of —— from rice straw. (P) Rogers and Bedford 555A
Manufacture of —— from sawdust in Switzerland .. 322R
Manufacture of —— from seaweed. (P) Bayer and Orlajensen 499A
Manufacture of —— from wood. (P) Moore, and Brown Co. .. .. 190A•
Mode of pyrogenic decomposition at high temperatures, of ——. Peytral 206A
Modification of iodoform reaction for detecting ——. Kuns 764A
as motor fuel. Dixon 855R
Motor —— in Hawaii 841R
Power —— in Australia 236R

spontaneously oxidisable in the air Kohn-Abrest .. 158A
Tinning ——. (P) Page and Rubin 823A
transmission lines in Canada 147R
Treatment of —— with cadmium. (P) Buchalo .. 662A
in U.S.A. in 1918 .. .. 288R
vessels; Removing "scale" from ——. Gromfeld .. 475A
vessels; Use of —— in dairies Utz 39A
Welding or melting ——. (P) Chem. Fabr. Griesheim-Elektron 162A
-zinc alloys; Improving the mechanical properties of ——. (P) Hedderaheimer Kupferwerk u. Süddeutsche Kabelwerke 415A
-zinc-copper alloys Röenhain and others .. 109R, 370A

Aluminium-casein compounds; Manufacture of water-soluble ——. (P) Wilding 427A

Aluminium chloride; Action of —— on solutions of nitrohydrocarbons in aromatic hydrocarbons. Kliegl and Huber 777A

Aluminium chloride—*continued*.
Manufacture of ——:
(P) Burgess, and Standard Oil Co. 22A
(P) Fréry, and Aluminium Co. of America .. 749A
(P) Mardick 109A
Manufacture of anhydrous ——. (P) Danckwardt .. 545A
residues from treatment of mineral oils; Utilisation of ——. (P) Abbott, and Gulf Refining Co. .. 290A

Aluminium compounds; Manufacture of ——. (P) Goldschmidt, and Norske Aktieselskab for Elektrokem. Ind., Norsk Ind.-Hypotekbank 750A*
compounds; Manufacture of —— for sizing paper and other purposes (P) Muth 517A, 749A
compounds; Recovery of potassium compounds and —— from greensand. (P) Hauber, jun. 63A

Aluminium hydroxide; Extraction of —— from refractory bauxite. (P) Szirmay and Tetétleni .. 191A
Manufacture of non-colloidal ——. (P) Buchner, and Chemical Foundation, Inc 488A
in mechanically filtered water Howard and Hannan.. 581A
Precipitation of —— (P) Sherwin 820A*
Recovery of —— from strong aluminate liquors. (P) Szirmay and Tetétleni 191A
Washing and cleaning by means of —— (P) Buchner 756A

Aluminium iron phosphates; Utilisation of ——. Stanley 344A
nitrate; Manufacture of —— (P) Hood 689A
nitride; Furnace for manufacture of ——. (P) Herman 570A
nitride and the like; Manufacture of ——. (P) Shoeld, and Armour Fertilizer Works 570A
nitride, Manufacture of ——
(P) Armour Fertilizer Works, and Shoeld .. 406A*
(P) Gerber 657A
oxide; Hydrous ——. Weiser 781A
phosphate; Soluble —— Svanberg 19A
silicates, Treatment of naturally occurring ——. (P) Borchers 64A, 570A
sulphate; Manufacture of ——, free from iron, from clay (P) Papierfabr Köslin A.-G 109A
sulphate; Rapid estimation of —— in alum. Codwise 446A
Aluminosilicates; Decomposition of alkali ——. (P) Bergve 544A
Aluminothermic reactions; Manufacture of ferrosoferric oxide suitable for —— (P) Bredig and others .. 191A
Aluminous materials; Conversion of powdered —— into granular form (P) Hood 657A
materials, Purification of ——. (P) Hutchins .. 690A*
Alundum filtering crucibles, Use of ——. Englis .. 677A
Alunite, Process of treating —— (P) Downs .. 489A
Utilisation of native —— (P) Chappell 405A
Amalgam presses. (P) Cocks 823A
Amalgamators, Centrifugal —— (P) Musser 493A*
Amalgams, Electro-endosmosis, and preparation of solid alkali —— Frank and Withrow 455A
American Ceramic Society 131R
American Chemical Society .. 115R, 183R, 217R, 338R
American Petroleum Institute 14R
Amides of alkalis and alkaline-earths, Manufacture of ——. (P) Badische Anilin und Soda Fabrik .. 749A
of N-arylglycinearsonic acids Jacobs and Heidelberger 41A
of N-arylglycinearsonic acids, Aromatic —— Jacobs and Heidelberger 42A
Production of formic acid by yeast in media containing —— Thomas 421A
Utilisation of —— by yeast. Thomas 77A
Amines; Iodination of aromatic —— by means of iodine and persulphate. Elbs and Volk 173A
Manufacture of aromatic —— (P) Du Pont de Nemours and Co 280A
Oxidation of —— Goldschmidt 224A
Preparation of —— by catalysis Malihe 466A
Substituting halogens for amino groups in aliphatic —— (P) Chem Fabr Flora 385A
Sympathomimetic ——. Madinaveitia 526A
Aminoacetanilide, Preparation of ——. Hill and Kelsey 673A
Amino-acids in cane juice, Influence of —— on sugar technology Waterman and Van Ligten 794A
Determination of —— by means of the hydrogen electrode Tague 481A
Preparation of esters of ——. Foreman 277A
Rapid volumetric determination of —— Foreman .. 613A
α-Amino-acids, Manufacture of complex silver salts of ——. (P) Napp 640A
2-Aminoanthraquinone, Manufacture of ——. (P) Fischer, and Geigy S A 442A*, 480A*
o-Aminocinnamylidene-quinaldine methiodide; Synthesis of ——. Mills and Evans 685A
Amino-derivatives of naphthalene; Sympathomimetic ——. Madinaveitia 526A
Aminohydrindenecarboxylic acid; Manufacture of a phenylated ——. (P) Chem Werke Grenzach A.-G. .. 802A
Aminosulphonic acids, Manufacture of ——. (P) Traube 427A
Manufacture of tanning substances from N- and O-arylsulpho derivatives of aromatic ——. (P) Ges. f. Chem. Ind. in Basel 666A
o-Aminothiophenol; Action of —— on ortho-quinones. Stahrfoss 238A
Aminotoluic acids; Alkamine esters of——and other similar compounds of such acids. (P) Wildman, and Parke, Davis, and Co. 426A

Ammonia; Advantages of synthesis of —— at very high pressures. Claude .. 187A
Apparatus for catalytic preparation of nitrogen oxides from ——. (P) Barth .. 782A
Apparatus for production of synthetic ——:
(P) Gardiner .. 334A
(P) General Chemical Co., and De Jahn .. 108A
Apparatus for purifying nitrogen-hydrogen mixtures prior to synthesis of ——. (P) General Chemical Co., and De Jahn .. 589A
Catalyst for oxidation of ——:
(P) Manchot and Haas .. 190A
Perley .. 187A
Catalytic oxidation of ——:
Neumann and Rose .. 264A
(P) Tallani .. 365A*
Catalytic production of nitrogen oxides from ——. (P) Permutit A.-G. .. 688A
Catalytic synthesis of ——. Guichard and others .. 362A
Colorimetric determination of —— in water Kolthoff 761A
coolers; Working of ——. (P) Klönne .. 334A
Determination of —— in the gases in the synthetic process. (P) Rideal and Tarrant .. 516A
Determination of —— in oil and fat preparations, such as Turkey-red oil etc. Welwart .. 727A
Determination of —— in soils. Matthews .. 308A
Determination of —— in urine, serous liquids, and the oxidised liquid of the Kjeldahl method. Hahn and Kootz .. 735A
Direct recovery of —— from distillation gases. (P) Plette, and Soc Franco-Belge de Fours a Coke .. 814A*
Disposal of waste liquor in recovery of —— from distillation gases (P) Phœnix A.-G. fur Bergbau u. Hüttenbetrieb .. 395A
Distillation of —— in analysis Davisson .. 310A
Electrically heated bomb for synthesis of —— Davis and Bryan .. 401A
Equilibrium in the system ammonium thiocyanate ——. Foote and Hunter .. 265A
flame; Formation of free hydrogen in the reversed —— Müller .. 187A
Franco-German convention in connexion with production of synthetic —— 305R
gas, Action of very concentrated solutions of iodic acid on —— Denigès and Barlot .. 781A
gas equilibrium, Calculation of the —— Maurer .. 61A
gas, Iodic acid as microchemical reagent for gaseous —— Denigès .. 595A
German comments on Claude's process for synthetic production of —— .. 114R
and the like, Manufacture of —— (P) Calvert .. 404A
Manufacture of —— (P) Haslup .. 110A*
Manufacture of —— from ammoniacal liquor and milk of lime (P) Otto und Co .. 627A
Manufacture of ammonium salts from industrial gases containing —— (P) Chem Fabr Kalk .. 22A
Manufacture of anhydrous —— (P) Lowenstein .. 21A
Manufacture of —— from atmospheric nitrogen. (P) General Chemical Co, and De Jahn .. 231A
manufacture, Claude process of synthetic —— .. 381R
Manufacture of combustible gas or coke and —— from peat and the like (P) Sauer .. 6A
Manufacture of —— from crude ammoniacal liquor. (P) Pirch .. 108A
Manufacture of —— from crude calcium cyanamide. (P) Otto und Co .. 448A
Manufacture of —— from crude cyanides (P) Metzger, and Air Reduction Co .. 749A
Manufacture of —— from cyanamide (P) Brodtkorb, and Norsk Hydro-Elektrisk Kvaelstofaktieselskab 295A*
Manufacture of cyanides for preparation of ——. (P) Thorssell and Lundén .. 190A
Manufacture of cyanogen and ——. (P) Balfour-Guthrie Investment Co .. 579A*
Manufacture of dicyanodiamide and —— from crude calcium cyanamide. (P) Stickstoffwerke Ges .. 404A
Manufacture of dry —— from nitrolim. (P) Wiedemann 656A
Manufacture of formates and —— from cyanides, ferrocyanides, and cyanised briquettes. Heise and Foote .. 362A
Manufacture of —— from gas liquor (P) Schuchardt 742A
Manufacture of mixtures of hydrogen and nitrogen by decomposition of ——. Davis and Olmstead .. 362A
Manufacture of mixtures of nitrogen and hydrogen for synthesis of ——:
(P) Ellis and Lutkins .. 231A
(P) Gerfin and others .. 656A
(P) Harger .. 516A
Manufacture of nitric acid from ——. (P) General Chemical Co, and De Jahn .. 748A
Manufacture of nitric oxide from ——. (P) Bayer und Co. .. 64A
Manufacture of synthetic ——:
(P) Clancy, and Nitrogen Corp. .. 688A
(P) Claude, and L'Air Liquide .. 335A*
(P) Gardiner .. 231A
(P) Greenwood .. 231A, 488A, 688A
(P) Metzger .. 334A
(P) Rideal and Tarrant .. 516A
Material for use in operations with hydrogen under high pressure and at high temperatures, especially for catalytic preparation of ——. (P) Badische Anilin u. Soda Fabrik .. 656A

Aniline Black—*continued*.
Production of —— upon vegetable textile fibres. (P) Fourneaux 655A*
Production of —— upon vegetable textile fibres, silk fibres, or mixtures of the same. (P) Fourneaux .. 187A*
Resists and conversions under ——. Pluzanski .. 569A
Animal by-products. Dunford 375B
fats. *See under* Fats.
oils. *See under* Oils, Fatty.
Anions; Indirect electrolytic estimation of —— without platinum electrodes. Lasala 139A
Annealing furnaces. *See under* Furnaces.
Anodes; Electrolytic ——. (P) Antisell 414A
Anthocyanin colouring matters of the beet-red group; Occurrence and reaction of ——. Kryz 442A
Anthocyanins present in young leaves of grape vine. Rosenheim 399A
Use of butyl alcohol as a solvent for ——. Rosenheim 262A
Anthocyans and related compounds; Tinctorial properties of ——. Everest and Hall 61A
Tinctorial properties of the ——. Everest 483A
Anthracene; Catalytic oxidation of ——. (P) Weiss and others 743A
press-cake; Treatment of ——. (P) Andrews, and Selden Co 100A
Production of pure ——. (P) Leroux, and Soc. d'Eclairage, Chauffage, et Force Motrice 152A*
Anthracene dyestuffs:
Alizarin; Action of potassium hypochlorite on—— in alkaline solution. Scholl 57A
Benzalizarin. Perkin 623A*
Hydroxyanthraquinones, Metallic derivatives of ——. Crossley 152A
Hydroxydianthraquinonyls; Oxidative formation of —— from hydroxyanthraquinones. Scholl and others 152A
Indanthrene Blue; Printing reserves under ——. Pokorny 745A
Pyrazole-anthrone Yellow; Derivatives of ——. (P) Singer and others 225A*
Anthracite; Burning steam sizes of —— with or without admixture of soft coal. Frey 146A
dust; Manufacture of fuel from —— (P) Steel .. 325A
Treatment of gases from —— in manufacture of carbon electrodes. (P) Meiser 480A
Anthradiquinones. Dimroth and others 399A
Anthranilic acid; Manufacture of ——. (P) Potter, and Barrett Co 9A
Anthranol; Manufacture of ——. (P) Perkin 743A
Anthraquinone derivatives; Manufacture of ——. (P) Cassella und Co 816A*
Nitro-derivatives of ——. Dhar 685A
Purification of crude —— (P) Andrews, and Selden Co. 100A
Anthrax; Toxicity towards —— of solutions containing phenol and sodium chloride Lemon 799A
Anti-dimming compositions for use in gas masks Carleton 79A
preparations for gas masks. Holmes and others . 79A
Antidiphtheric sera; Titration of ——. Nicolle and others 172A
Antifriction metal *See under* Metal.
Antimony; Alloy to serve as substitute for —— in hard lead and similar products. (P) Zimmer .. 30A, 161A
-copper alloys; Expansion of —— Bracco . . 195A
Determination of —— in lead-antimony alloys. Bertiaux 693A
developments in New Brunswick 319B
ores; Geological Survey report on —— 203B
ores; Output of —— in Bolivia 221B
ores; Treatment of ——. Hulst 116A
Separation of tin and ——. Kling and Lassieur .. 470A
in U.S.A. in 1918 .. .. 57B
Antimony colours for rubber. (P) Morris 273A
compounds; Aromatic ——. Schmidt 763A
compounds; Rôle of —— in tropical medicine. Fargher 333B
Compounds of —— with tartaric acid Blanchetière 543A
oxide pigments; Manufacture of white —— (P) Barbe 377A
pentachloride and its additive compounds; Aromatic derivatives of ——. Schmidt 763A
sulphide; Golden ——. Kirchhof 721A
sulphide, Manufacture of gold-coloured ——. (P) Chaillaux 730A
sulphide; Rapid determination of —— in rubber goods and reclaimed rubber. Schmitz 307A
sulphides; Chemical examination of ——. Van Rossem and Dekker 791A
trisulphide; Formation of black modification of ——. De Bacho 230A
Anti-neuritic properties of foods; Influence of high temperatures and dilute alkalis on ——. Daniels and McClurg 169A
substance; Factors which interfere with use of yeast as test organism for ——. Sousa and McCollum .. 830A
Antipyrine-benzoic acid; The binary system ——. Kremann and Markti 557A
in pyramidone; Colour test for ——. Escalch .. 642A

Calcium cyanamide—*continued*.
Decomposing crude —— mixed with a liquid by means of carbon dioxide. (P) Zarniko 498A
Decomposition of crude ——. (P) Chem. Fabr. Kalk 488A
Determination of cyanamide and dicyanodiamide in ——. Marqueyrol and others 553A
Determination of cyanamide nitrogen in crude ——. Neubauer 794A
Electrically heating the reacting materials in manufacture of crude —— (P) Novak 488A
Granulating ——. (P) Barbé 279A
Granulating —— for use as fertiliser (P) Saves .. 759A
Improvement of crude —— for use as fertiliser. Baumann 275A
Influence of iron oxide and sodium chloride upon fertilising action of —— Lemmermann and Einecke 75A
Influence of storage on nitrogen losses and nitrogen changes in crude —— Meyer and Gorkow .. 75A
Inorganic impurities in crude —— Baumann .. 379A
Manufacture of ammonia from ——.
(P) Brodtkorb, and Norsk Hydro-Elektrisk Kvaelstofaktieselskab 295A*
(P) Otto und Co 448A
Manufacture of ammonia and dicyandiamide from crude —— (P) Stickstoffwerke Ges. 404A
Manufacture of crude ——.
(P) Duchemin 488A
(P) Novak 488A
Manufacture of cyanamide solutions from crude ——. (P) Danneel, and Elektrizitätswerk Lonza .. 749A
Manufacture of dry ammonia from ——. (P) Wiedemann 656A
Manufacture of Portland cement from waste product from decomposition of —— Baumann 599A
Means of emptying the furnace in manufacture of crude —— (P) Dienemann 420A
oven (P) Cox, and American Cyanamid Co 191A
Physiological action of crude —— Siebner 498A
Preparation and properties of pure ——. Kameyama 818A
production in Germany 382R
Production of non-dusty crude —— 360R
Steam consumption in manufacture of ammonia from crude —— Baumann 401A
Use of —— in case-hardening baths Shimer .. 39R
Variety of carbon present in crude —— Remelé and Rassow 485A
as a vegetation factor Linter 166A
Yields in manufacture of —— Pluvinage 485A
Calcium cyanide from calcium cyanamide Landis .. 265A
fluoride precipitate, Obtaining ——. (P) Chase, and National Carbon Co 232A
hydride, Manufacture of —— (P) Kieselwalter .. 406A
hydride, Some reactions of —— Reich and Serpek 230A
hydroxide, Carrying down of —— by precipitates of ferric hydroxide Toporescu 503A
hydroxide. *See also* Lime
iodide, Manufacture of organic derivatives of ——. (P) Spitz 467A
nitrate, Determination of nitrogen in —— Platou 401A
oxalate, Manufacture of —— (P) Dupont and Hanke 675A
oxide, Extraction of —— from calcined magnesite. Duschak 747A
oxide, Manufacture of compact blocks of —— from calcium hydroxide sludge. (P) Bayer und Co. 626A
oxide. *See also* Lime
phosphate; Manufacture of colloidal preparations of amylodextrin and —— (P) Lecinwerk Laves .. 802A
phosphate, Manufacture of di- ——, and fertiliser produced therewith (P) Sadtler 201A
phosphate, Recovering proteins, magnesium phosphate, and —— from acid waste waters from maize steeping (P) Giesecke 671A, 798A
phosphates, Application of a physico-chemical method of analysis of precipitates to study of ——. Jollibois 107A
phosphates, Mechanical treatment of tri- ——. (P) Comp des Phosphates de Constantine 794A
saccharate; Coagulation of rubber latex with ——. Stevens 826A
salts, Antagonistic action of —— towards other salts in soils as measured by ammonification and nitrification Greaves 758A
silicate; Effect of di- —— on an acid soil Hartwell and Pember 698A
Calcium sulphate cements, Setting of ——. Haddon 162R, 165T
Effect of —— on cement Witt 336A
Effect of —— on solubility of soils. McCool and Millar 497A
Formation of double salts of potassium sulphate and —— at 100° C Anderson and Nestell 401A
Manufacture of ammonium sulphate from ——. (P) Badische Anilin u. Soda Fabr 364A
Manufacture of ammonium sulphate from gas-liquor and ——. (P) Otto und Co 488A
Manufacture of colloidal preparations of amylodextrin and ——. (P) Lecinwerk Laves 802A
Manufacture of hydrogen sulphide from ——. (P) Beck 364A
Manufacture of sulphur from ——. (P) Badische Anilin u. Soda Fabr. 365A, 570A
Manufacture of sulphur oxides from ——. (P) Badische Anilin und Soda Fabr. 61A, 570A
Manufacture of sulphuric acid from ——. (P) Behrens 748A

Caoutchouc—*continued.*
substances and vulcanisation products; Manufacture of ——. (P) Bedford, and Goodyear Tire and Rubber Co. 123A
Vulcanising dissolved ——. (P) Peachey 605A
See also Rubber.

n-Caprole acid and its derivatives; Preparation of ——. Adams and Marvel 279A

Capsaicin; Constitution of ——. Nelson 348A

Capsicum: Constitution of capsaicin, the pungent principle of ——. Nelson 348A

Caramel content; Determination of —— as means of estimating sugar lost by superheating in the refinery. Koydl 420A
Manufacture of ——. (P) Daniel 345A
Presence of furfural in —— 288R

Carbamide. *See* Urea.

Carbazole; Manufacture of high-percentage ——. (P) Soc. d'Eclairage, Chauffage, et Force Motrice 9A, 328A*
Manufacture or isolation of ——. (P) Burt, Boulton, and Haywood, Ltd., and Miles 328A
Metallic salts of ——. Franklin 348A
Purification of ——. (P) South Metropolitan Gas Co., and Kirby 291A, 623A*

Carbides; Manufacture of nitrogen compounds from ——. (P) Carlson, and Aktiebolaget Nitrogenium .. 450A*

Carbocyanines *See under* Quinoline dyestuffs.

Carbodiphenylimide; Preparation of —— from *symm*-diphenylthiourea by means of arsenic trioxide. Herzog 481A

Carbohydrates contained in plants, vegetable offal, and natural and industrial waste products; Utilisation of —— (P) Darrasse Frères, and Dupont .. 499A
Ethylene oxide structure of some ——. Armstrong and Hilditch 700A
of fresh and dehydrated vegetables. Falk 131A
Manufacture of acetates, etc., from ——. (P) Randall, and Industrial Chemical Co. 783A
Manufacture of alkyl ethers of ——. (P) Lilienfeld, and Chemical Foundation, Inc. 654A*
Manufacture of explosives from —— (P) Harburger Chem Werke Schön und Co, and Daltz 735A
Manufacture of saccharic and tartaric acids from ——. (P) Diamalt-A.-G. 704A
Procuring and securing products from ——. (P) Reid, and International Nitrogen Co 755A
Treatment of residues containing ——. (P) Effront and Boldin 130A

Carbon, Apparatus for determination of —— in steel. Dovey 706A
black, Apparatus for estimating yield of —— from natural gas Neal 342A
black; Apparatus for producing ——. (P) Paterson .. 577A
black; Channel process of making —— Neal .. 791A
black, Disc, plate, and cylinder processes for production of ——. Neal 791A
black; Properties and uses of ——. Perrott and Thiessen 377A
Combustion of ——. Müller 217A
Decolorising ——. *See under* Decolorising
Determination of —— in ferro-alloys Rottmann .. 367A
Determination of free —— in tar. Waterman and Barkhuysen 150A
Determination of —— in iron Yensen 367A
Determination of —— in organic substances. Lescœur 469A
Determination of —— in steel 201R
Direct formation of carbon monoxide by burning —— in pure oxygen Müller 217A
Electrical endosmose of molten sodium chloride into —— Ostwald 29A
electrical resister, Zig-zag ——. (P) Thomson .. 29A
electrodes. *See under* Electrodes.
Equilibrium between methane, hydrogen, and ——, Coward and Wilson 94A
Free —— in coal tar and pitch. Hodurek 622A
graphitic, Determination of ——. Selvig and Ratliff .. 486A
and the like, Manufacture of substantially pure ——. (P) Williams, and Nitrogen Products Co 689A
Manufacture of gaseous fuel and ——. (P) Rose .. 715A
rods, Furnace for baking ——. (P) Melser 755A
temper-; Crystalline nature of —— obtained from cast iron Jokibe 785A
Variety of —— formed in reaction between calcium carbide and nitrogen. Remelé and Rassow .. 485A

Carbon bisulphide; Extraction and recovery of ——. (P) Colman and Yeoman 567A
Interaction of —— with ammonium carbonate. Gilchan 801A
Manufacture of ——. (P) Dow and others 657A
Proposed manufacture of —— in New Zealand .. 147R

Carbon dioxide; Absorption apparatus for determining —— in flue gases. (P) Boulton 210A
Apparatus for determination of —— in furnace-gases. (P) Cossor 283A
Apparatus for determining small quantities of ——. Costantino 175A
Ascarite, an absorbent for ——. Davidson 71R
content of natural waters; Relationship of hydrogen ion concentration to ——. Orcutt and Baker 796A
Continuous electrolytic determination of —— in flue-gases etc. Von Hahn 618A
Determination of ——. Slator 126R, 149R

PAGE

Carbon dioxide—*continued.*
Determination of —— in bicarbonates in presence of carbonates. Hartmann 746A
Determination of —— in insoluble carbonates. Robinson 687A
Determination of ——, in moorland water. Rodt .. 556A
Determination of solvent —— in water. Noll .. 581A
Enriching atmosphere surrounding plants with ——. (P) Riedel 667A
fertiliser; Use of blast furnace waste gases as ——. Riedel 125A
Influence of atmospheric —— on alkalimetric titrations with phenolphthalein as indicator. Bruhns .. 678A
Manufacture of ——. (P) Newhouse, and Allis-Chalmers Manufacturing Co. 294A
Manufacture of acetone and ——. (P) Soc. Anon. Aciéries et Forges de Firminy 44A
Manufacture of a highly efficient absorbent for ——. (P) Von der Heide 406A
Manufacture of technically pure nitrogen, hydrogen, and —— from natural gas and air. (P) Herman .. 267A
Micro-analytical determination of water and —— in minerals Almström 176A
Micro-analytical determination of oxygen, combustible gases, and ——. Schmit-Jensen 316A
recorders and their application in boiler efficiency control. Oldham 144B
Recovering —— from gases. (P) Deutsche Oxhydric A.-G. 783A
Reduction of —— by extremely finely divided hydrogen. Zenghelis 596A
Treatment of garbage and production of —— therefrom. (P) Danks 40A
Utilisation of impure gases containing ——. (P) Riedel 489A
See also Carbonic acid

Carbon monoxide; Apparatus for indicating and recording quantities of —— in hydrogen or gases containing the same and for like purposes. (P) Rideal and Taylor 23A
Determination of —— in air contaminated with motor exhaust gases. Teague 768A
Direct formation of —— by burning carbon in pure oxygen Müller 217A
Electromotive activation of ——. (P) Hofmann .. 416A
Electromotive activity of ——. Hofmann 515A
Interaction of steam and —— as conditioned by iron oxide and by copper Armstrong and Hilditch .. 446A
Oxidation of ——. (P) Hofmann 431A
Production of —— in flames of gases. Kling and Florentin 147A
Rapid determination of —— in air. Lamb and Larson 132A
Removal of —— from air. Lamb and others 424A
Removal of —— from gas mixtures. (P) Fränkel 742A
Treating gases containing —— in connexion with synthesis of ammonia. (P) General Chemical Co., and De Jahn 543A
Uniform movement of flame in mixtures of air with mixtures of methane, hydrogen, and ——. Payman 95A

Carbon tetrachloride fire extinguishers, Poisonous gases from —— Fieldner and others 397B, 800A
Velocity of adsorption of —— by charcoal Harned .. 424A

Carbonaceous materials, Apparatus for distillation of ——. (P) Burney 149A
(P) Perry 511A, 566A
(P) Wallace 748A*
materials, Apparatus for recovering oil from —— (P) Wallace 743A*
materials; Carbonising ——. (P) Wells .. 685A
materials, Destructive distillation of —— (P) Perkin, and Nitrogen Products and Carbide Co., Ltd 8A
(P) Poore 814A
materials; Extracting hydrocarbons from ——. (P) Rock 593A
materials; Heating of vertical retorts for distillation of ——. (P) West and others 813A
materials; Manufacture of hydrocarbon liquids from ——. (P) Rousseau 716A
materials; Retorts for distilling —— (P) West and others 741A

Carbonate rocks; Determination of combustible matter in ——. Fiekiner and others 155A

Carbonates; Conductometric titration of —— Kolthoff 735A
Determination of carbon dioxide in insoluble ——. Robinson 687A
Investigation of mixtures of phosphates and —— in presence of capillarily active indicators of acid and alkaline nature. Windisch and Dietrich .. 524A
Investigation of —— in presence of capillarily active indicators of acid and alkaline nature. Windisch and Dietrich 524A
Manufacture of alkali ——. (P) Hene and Van Haaren 110A

Carbonation of beverages; Electrical —— (P) Bloom .. 4A

Carbonic acid; Conductometric titration of ——. Kolthoff 735A
Prolonged action of —— on silicates and quartz. Matignon and Marchal 490A
See also Carbon dioxide

Carboniferous material; Utilisation of low-grade —— in manufacture of Portland cement. (P) Lesley .. 65A
substances; Gasification of ——. (P) Strache .. 439A

Carbonisation of bituminous substances; Two-chambered shaft kiln for low-temperature ——. (P) Torfentgasung-Stauber Ges. 815A
of cellulose, peat, etc. by treatment under pressure and heat in presence of liquids. (P) Billwiller .. 815A

Caustic pot settings Wheeler .. 332A
potash. *See* Potassium hydroxide.
soda. *See* Sodium hydroxide
Celloisobiose Ost and Prosiegel .. 421A
Cellulold, Determination of nitrogen in —— with the nitrometer Nicolardot and Vourloud .. 174A
films Obtaining products from —— (P) Pierson .. 686A
industry. Sproxton .. 352R
industry in Japan .. 170R
industry in Switzerland .. 306R
or the like, Manufacture of substitutes for ——. (P) Robinson-Bindley and others 14A, 307A*, 568A
-like masses, Manufacture of —— (P) Dreyfus .. 445A*
Manufacture of films and plates of —— (P) Deutsche Celluloid-Fabr. .. 227A
Manufacture of uninflammable —— (P) Dreyfus .. 153A*
manufacturers, Combination of Japanese —— .. 14R
products, Recovering silver from —— (P) Horton 676A
substitutes, Manufacture of —— (P) Bayer und Co 624A
Cellulose, Absorbent power for gases, and constitution of —— Oddo .. 12A
Action of alkaline-earths on incrustations of various kinds of ——. Schwalbe and Becker .. 512A
Action of hydrogen peroxide on —— Haller .. 817A
Adsorption capacity of —— Rona and Michaelis .. 594A
Apparatus for bleaching —— (P) Berglind .. 227A*
Cantor lectures on —— Cross .. 124R
Carbonisation of —— by treatment under pressure and heat in presence of liquids (P) Billwiller .. 815A
Catalytic action in oxidation of ——. Wilson 128R, 177T
Colloidal —— Schwalbe .. 58A
Constitution of —— Hess .. 512A
cotton-; Application to industry of recent researches on viscosity of —— Panter .. 333T
and its derivatives, Continuous washing and dehydration of —— (P) Müller .. 400A
Determination of —— in rubber goods Epstein and Moore .. 343A
Determination of —— in wood
Dore .. 400A
Mahood .. 718A
Digestion of woody fibres with chlorine for production of ——. Waentig and Gierisch .. 817A
Disintegrating and extracting liquid from crude —— (P) Melzer .. 565A
Dissociation of mordant salts by —— Schwalbe .. 58A
Drying —— in continuous strips (P) Mallickh .. 153A
and its esters Duclaux and Wollman .. 528A
fabrics; Improving —— (P) Exportingenieure für Papier- und Zellstofftechnik .. 185A
Fermentation of —— Fowler and Joshi .. 93R
Fermentation of —— for production of acetic acid. (P) Power Gas Corporation, and Langwell .. 38A
fibres; Manufacture of ——. (P) De Cew .. 744A
formations; Production of ——. (P) Mineh .. 103A
Heating —— with benzene under pressure. Fischer and Schneider .. 225A
hemi-; Manufacture of —— from wood by the soda process. (P) Kittelsen and Kittelsen .. 779A
Manufacture of gas mantles from ——. (P) Deutsche Gasglühlicht A.-G .. 441A
Manufacture of —— from highly lignified plants. (P) Löders .. 226A
manufacture; Measuring and regulating acidity of sulphite liquor for ——. (P) Crandon, and Crandon Manufacturing Co. .. 483A
Manufacture of —— from moss or peat. (P) Hildebrandt .. 227A

Cellulose—*continued.*
manufacture; Removing water from the pulp sheet in ——. (P) Wagner, and Aktiebolaget Karlstads Mekaniska Verkstad 624A*
Manufacture of solutions of —— or of materials containing cellulose. (P) Zellstoff-fabrik Waldhof .. 14A
Manufacture of —— from wood or other cellulosic material. (P) Zellstoff-fabrik Waldhof, and others 60A
materials; Prolonged action of a moderate heat on ——. Knecht 540A
Methylation of ——. Denham 414R
Modification of —— in the beetling process. Cross .. 58A
mucilage Schwalbe and Becker .. . 330A, 330A
Nitration of ——:
(P) Claessen 469A
(P) Vajdafy 429A
Nitration of webs of ——. (P) Niederländer .. 835A
Preparation and properties of a highly oxidised ——. Knecht and Thompson 718A
preparations; Purifying and improving ——. (P) Elektro-Osmose A.-G. 60A
Process of dissolving ——. (P) Ostenberg, and International Cellulose Co 624A
products; Displacing liquids from —— by other liquids (P) Elektro-Osmose A.-G. 208A
Purification of different kinds of —— Schwalbe and Becker 512A
and similar solutions, Manufacture of a wool substitute from —— (P) Glanzfäden A.-G 13A
soda-, Elimination of malodorous substances from waste gases from manufacture of —— (P) Schwalbe 541A
soda-, Manufacture of —— (P) Rinman 360A*
soda-, Manufacture of —— from vegetable materials (P) Müller 745A
soda-; Manufacture of —— from wood, straw, esparto, rushes, bamboo, manila, and other vegetable materials by double digestion (P) Müller 745A
solutions, Manufacture of artificial fibres from —— (P) Schreiner 719A
solutions, Viscosity of cuprammonium —— Gibson and others 541A
sulphite-; Detection of —— in tanning extracts Knowles 242A
sulphite-, Industry of —— in Sweden .. 341R
sulphite-, Method of indirect boiling in manufacture of —— (P) Ifult 445A
sulphite-, Recovery of cymene in manufacture of —— (P) Åkerblom 361A
sulphite-, Waste lyes from manufacture of —— *See under* Sulphite-cellulose
Titration of alkalinity or acidity of —— Qvist 443A
Turbidimeter for solutions of —— Sheppard 282A
Two-stage process of obtaining —— (P) Fuchs 779A
Use of —— as cattle fodder Scurti and Morbelli .. 464A
Utilisation of phosphoric acid from superphosphate manufacture in saccharification of —— (P) Schmidt, and Chem Fabr Rhenania .. 309A
waste lyes, Decolorisation of —— (P) Wipfler .. 779A
waste lyes, Dry distillation of concentrated —— (P) Schacht 445A
waste lyes, Dry distillation or drying of —— (P) Aktiebolaget Cellulosa, and Magnuson .. 359A
waste lyes, Dry distillation of —— with strong bases in presence of steam (P) Rinman .. 15A, 624A*
waste lyes, Manufacture of a material resembling dextrin from —— (P) Claass 719A
waste lyes, Material for sizing paper obtained from —— (P) Michl 779A
wood-; Manufacture of —— (P) Rinman .. 360A
wood-, Manufacture of highly-purified —— as substitute for cotton in chemical industries (P) Schacht 60A
wood-, Manufacture of material for nitration from cotton and —— (P) Claessen 315A
wood-; Preparation of material for nitration from —— (P) Claessen 429A

Cellulose acetate Fenton and Berry 624A
acetate compositions; Manufacture of ——:
(P) Jarvis 541A
(P) Seel, and Eastman Kodak Co. .. 541A
acetate compounds, Non-inflammable ——. (P) Lindsay, and Celluloid Co 14A
acetate films on glass. (P) Deuts Gasglühlicht A.-G .. 519A
acetate films; Manufacture of non-inflammable ——. (P) Stevenson 281A
acetate, Flexible product having a basis of ——. (P) Dupont, and Soc Anon. des Etabl Dupont .. 103A
acetate, Manufacture of ——:
(P) Levey 74A
(P) Lindsay, and Celluloid Co 445A
acetate; Manufacture of compositions, preparations, or articles having a basis of —— . (P) Dreyfus 14A, 745A*
acetate, Manufacture of guttapercha substitute, resistant to alcohol, from ——. (P) Skaller 445A
acetate product unaffected by cold, Manufacture of ——. (P) Knoll und Co. 483A
acetate solutions; Manufacture of ——:
(P) Steinmig 153A
(P) Tyrer 483A*
acetate solutions; Manufacture of —— and of celluloid-like masses, films, etc., therewith. (P) Dreyfus 445A*
acetates; Manufacture of ——. (P) Zdanowich 483A, 624A*
carbamic esters; Manufacture of ——. (P) Goissedet 817A*

Cellulose—*continued.*
derivatives; Adhesive for articles made of ——. (P) Bayer und Co. 361A, 719A
derivatives; Gelatinising ——. (P) Elektro-Osmose A.-G. 430A
derivatives; Increasing the softness and flexibility of products made from ——. (P) Bayer und Co. .. 400A
derivatives; Material treated with ——. (P) Byers, and Products Syndicate 242A
ester compositions; Manufacture of mixed ——. (P) Carroll, and Eastman Kodak Co. 745A
esters; Dynamometric examination of fabrics coated with solutions of ——. Clément and Rivière .. 481A
esters; Manufacture of ——. (P) Wagner 400A
esters; Manufacture of dissolved or gelatinised ——. (P) Bonwitt 541A
esters; Manufacture of lacquers, and solutions or masses of ——. (P) Chem. Fabr. von Heyden A.-G. 779A
esters; Manufacture of plastic gummy material from ——. (P) Clouth 568A
esters; Softening ——. (P) Redlich 264A
ethers; Increasing the softness and flexibility of articles made from ——. (P) Bayer und Co. 719A
hydrate; Cleaning and polishing powder from —— for use in dentrifices, metal polishes, and the like. (P) Slaight and others 16A*
nitrate. *See* Nitrocellulose.
phthalate; Preparation and properties of ——. Levey 624A

Cellulosic materials; Conversion of —— into easily digestible fodder. (P) Lehmann 423A
materials; Digestion of —— with the aid of chlorine. (P) Franz 745A
materials, Direct estimation of lignin in ——. Klason 482A
materials, Saccharification of —— with gaseous hydrochloric acid. (P) Chem. Fabr. Rhenania, and others 311A
materials, Saccharification of —— by means of sulphuric acid:
(P) Zellstoff-fabr. Waldhof, and Clemm .. 203A
(P) Zellstoff-fabr Waldhof, and Hottenroth .. 204A
materials, Saccharification of plant material containing ——. (P) Schwalbe 346A
materials; Saccharification of —— with simultaneous recovery of citrate-soluble phosphate. (P) Chem. Fabr. Rhenania A.-G., and others 463A
materials; Wet-carbonising of ——. (P) Testrup, and Wetcarbonizing, Ltd. 56A
plant materials, Production of foodstuffs or fodder from —— (P) Strahl 423A
substances; Determination of reducing values of ——. Knecht and Thompson 718A

Cement, acid-proof; Manufacture of moulded articles from —— (P) Windsor-Richards 821A
Apparatus for manufacture of ——. (P) Boillot and Daudignac 431A*
Burning —— in shaft furnaces. (P) Fellner und Ziegler 785A
Calcining ——. (P) Helmsoth 491A
compositions; Manufacture of oxysalt ——. (P) Catlett 821A*
Compositions for and manufacture of waterproof ——. (P) Badder and others 409A
Compressed air inlet for kilns for burning ——. (P) Amme, Giesecke, und Konegen A.-G 288A
Effect of calcium sulphate on ——. Witt 336A
Effect of fineness of ——. Abrams 297A
Effect of storage on ——. Abrams 547A
Exports of —— 384R
-fibre tiles, flues, sheetings, or the like; Manufacture of ——. (P) Steiger 659A
Forming a covering and hardening coating on, or impregnating articles or plastering of ——. (P) Sanders and Sanders 599A
Glazing —— for fireclay retorts and furnaces. (P) McMinn 192A
Improvement in manufacture of —— 218R
industry Watt 71R
industry in China 65R
Influence of additions of calcium sulphate or chloride on shrinkage of ——. Guttmann 784A
ingredient, Manufacture of —— (P) Meyer, and Chemical Foundation, Inc. 547A*
"Iron" Portland —— Lewis 409A
-kiln gases, Recovery of potassium nitrate from ——. (P) Chemical Construction Co 64A*
kilns; Apparatus for automatically discharging ——. (P) Candlot 26A
Magnesium oxychloride ——. (P) Shaw and Bole .. 337A
Manufacture of ——:
(P) Adamson 491A
(P) Baylor, and Louisville Cement Co. .. 113A
(P) Smidth & Co. 599A
Manufacture of hydraulic —— and alkali from alkali-ferous mineral substances. (P) Jungner .. 451A*, 820A*
Manufacture of —— from liquid slag in electric furnaces. (P) Wennerström 573A
Manufacture of paint oils suitable for ——. (P) Boehm, Ltd., and Reihl 241A
manufacture; Recovery of cement compounds in connexion with ——. (P) International Precipitation Co. 367A
Manufacture of —— from slag. (P) Boverouille .. 785A
Manufacture of sodium silicofluoride and hydraulic ——. (P) Esch 571A

Catalytic action of aluminium in the preparation of — — Meunier 526A
Impurities in benzene separated from industrial ——. Bourion 480A
Physico-chemical method of analysis of industrial ——. Bourion 425A

Chlorobenzol, Nitrating —— (P) Heyder, and Williamsburg Chemical Co 262A

Chlorobenzoylbenzoic acid, Manufacture of ——. (P) Weiss and others 743A

Chlorocarbonic esters Capelli 673A

Chloro-compounds, Combustion of organic —— by chromic-sulphuric acid mixture Guyot and Simon .. 351A

Chloro-derivatives; Preparation of —— from sulphonic derivatives Datta and Mitter 172A
-derivatives of propylene; Manufacture of ——. (P) Union Carbide Co 174A*

1-Chloro-2.4-dinitrobenzene, Preparation of picryl chloride by nitration of —— Frankland and Garner .. 257T

2-Chloro-5.6-dinitrocymene Lubs and Young 82A

o-Chlorodinitrotoluenes Morgan and Drew 623A

β-Chloroethyl phosphate Fischer and Pfahler 790A

Chloroform; Antiseptic action of ——. Salkowski .. 702A
from coke-oven gas Dey 349A
Determination of — — Schlicht and Austen .. 526A
Testing of —— Utz 312A

Chlorogenic acid, the tannin-like constituent of coffee. Freudenberg 274A

Chloropicrin Action of —— on the higher plants Bertrand 383A
Action of —— on parasites of wheat and on rats. Piutti 383A
Action of — — on yeast and on flora of wine. Bertrand and Rosenblatt 498A
Active chlorine in sludge from manufacture of ——. Trumbull and others 832A
Comparative action of — — on the weevil and the tribolium Bertrand and others 171A
Destruction of white ants by — — Feytaud 671A
Influence of temperature and other physical agents on insecticidal power of —— Bertrand and others.. 80A
Influence of varying quantities of lime on yield in manufacture of — — Trumbull and others .. 832A
Intersolubility of —— and water. Thompson and Black 831A
Manufacture of ——
(P) King 247A
(P) Orton and Pope 527A
Velocity of adsorption of —— by charcoal. Harned 424A

Chlorosulphamides, Manufacture of —— (P) Claass .. 583A

Chocolate; Apparatus for cooling —— (P) Savy .. 78A
Apparatus for grinding or mixing ——. (P) Rostraneckv 465A*
Cooling chambers for —— (P) Fours et Proc Mathv 310A
Manufacture of —— (P) Whitham 465A*

Cholanic acid, Transformation of cholesterol into ——. Windisch and Neukirchen 81A

Cholesterol, meta-; Preparation of —— (P) Lifschütz.. 576A

Cholesterol; Nephelometric values of —— Csonka .. 417A
Transformation of —— into cholanic acid. Windaus and Neukirchen 81A

Cholic acid; Manufacture of an acyl derivative of ——. (P) Riedel A.-G. 44A
Obtaining — — from bile. (P) Wieland 675A

Choline; Manufacture of salts or compounds of —— and of its higher homologues. (P) Verein. Chem. Werke A.-G. 43A

Chosen. *See under* Korea.

Chromates; Isolating or purifying alkali ——. (P) Soc. Ind. des Prod. Chim. 448A, 450A
Photo-oxidation of organic compounds by ——. Plotnikow 312I

PAGE

Chromates—*continued.*
Transforming alkali —— into bichromates: (P) Soc. Ind. de Prod. Chim. 365A*
(P) Vis 190A
Chrome-alum; Manufacture of——. (P) Hultman .. 545A, 820A*
-nickel steel. *See under* Chromium.
ore. *See under* Chromium.
steel. *See under* Chromium.
tanning liquors. *See under* Tanning.
Chromed dyeings; Fastness to fulling of ——. Reyl .. 17A
Chromic acid; Continuous process for regeneration of ——. McKee and Leo 188A
Conversion of sodium chromate into ——. (P) Soc. Ind de Prod. Chim 516A
Iodometric determination of —— in lead chromate. Gröger 34A
Chromic chloride solutions; Action of neutral chlorides upon ——. Baldwin 486A
oxide; Conversion of chromate and bichromate of sodium and potassium to ——. (P) Mooney .. 267A*
sulphate; Conversion of chromate and bichromate of sodium and potassium to ——. (P) Mooney .. 267A*
sulphate; New complex form of ——. Recoura .. 107A
Chromite in India 358R
in U.S.A. in 1918 .. .. 356R
Chromium-cobalt-molybdenum alloys, Analysis of ——. Camp and Marden 753A
-containing iron alloys; Manufacture of ——. (P) Fahrenwald 601A
Determination of —— in steel. Goldenberg 115A
Electrolytic ——. Sargent 370A
Influence of atmospheric oxygen on iodometric determination of ——. Meindl 469A
Influence of —— on corrosion of iron and steel Richardson and Richardson 752A
Influence of vanadium on determination of —— in high-speed tungsten-steel. Slawik 659A
-iron alloys; Manufacture of —— (P) Ballantine .. 787A
-nickel alloys for thermo-couples (P) Heraeus .. 318A
-nickel steel. (P) Speer 695A*
-nickel steel for aeroplane shafts, Manufacture of ——. Kothny 492A
-nickel steel; Influence of deoxidation and duration of solidification on electro —— Kothny 299A
-nickel steel shells; Manufacture of —— (P) Hadfield 823A*
-nickel steels; Brittleness in —— Rogers 453A
-nickel steels; Substitutes for —— Kothny 114A
-nickel steels; Temper-brittleness in —— Greaves and Jones 602A
ore deposits in Asia Minor 77R
ore production, etc., in 1913-1919 .. .. .. 399R
ores, Occurrence of —— in South Africa 236R
production etc., 1913-1919 .. .. 399R
Separation of iron, aluminium, glucinum, titanium, zirconium, and —— by means of sodium carbonate Wenger and Wuhrmann 46A
Separation of manganese and —— Hershkowitsch 502A
-steel alloys (P) Cox, and Midvale Steel and Ordnance Co. 371A
in steel; Determination of small quantities of ——. Evans 414R
-steel; Heat-treatment of high- —— French and Yamauchi 600A
-steel; Manufacture of ——. 787A
(P) Ballantine 724A
(P) Sicard, and U.S. Ferro-Alloys Corp 724A
-steels containing double carbides. Oberhoffer and Daeves 822A
-steels; Effect of heat treatment on electrical resistivity of ——. Edwards and Norbury 451A
-steels; Physical constants of —— Matushita .. 629A
-steels; Properties of —— Edwards and others .. 453A
-steels; Structure of —— Monypenny 453A
-titanium-iron alloys, Manufacture of —— (P) Sicard, and U.S. Ferro-Alloys Corp 724A
Chromium chromate Jovitchitch 229A
compounds; Action of —— on plant growth Pfeiffer and others 606A
compounds, Manufacture of —— in South Africa .. 379R
hydroxide; Formula of —— Jovitchitch 229A
salts; Isolation of —— (P) Vis 190A
sulphate, basic, Manufacture of —— and its application to tanning and other uses (P) Morel 626A
sulphate; Constitution of the lilac grey complex —— Recoura 542A
Chrysalis oil. *See under* Oils, Fatty.
Cinchona bark from East Africa and the Cameroons .. 382R
preparations; Assay of ——. Lehmann 762A
trade of Dutch East Indies 386R
Cinematograph films; Manufacture of —— (P) Finnigan and Rodgers 428A
(P) Kelley, and Prizma, Inc. 468A
films; Manufacture of non-inflammable —— (P) Stevenson 281A
films; Production of coloured ——: (P) Douglass 126A
(P) Finnigan and Rodgers 281A
pictures; Production of coloured ——. (P) Kelley, and Prizma, Inc. 83A
Cinematography; Colour ——. (P) Kelley 705A*

PAGE

Cineol; Cresineol, a compound, of *o*-cresol and ——. Cocking 266R, 610A
Determination of ——. Bennett and Salamon .. 704A
Determination of —— in essential oils. Kleber and Von Rechenberg 763A
Determination of —— in eucalyptus oils. Cocking 266R, 610A, 832A
Cinnabar; Discovery of —— in Chile 400R
Cinnamic acid; Identification of ——. Denigès 673A
Citraconic acid; Electrolytic decomposition of alkali salts of ——. Henrich and Schenk 162A
Citric acid; Caking of ——. Lowry and Hemmings .. 105T
Detection of free and combined ——. Brocksmit .. 173A
Manufacture of ——: (P) Citro Chemical Co. of America 207A*
(P) Golding and others 174A
Synthesis of ——. Weiss and Downs 57R
Citrus fruits; Extracting oils from peel of ——. (P) McDermott 765A
trees; Destroying scale and the like on ——. (P) Blumenberg 465A
Civet; Adulteration of ——. Nivière 763A
Clarification of salt solutions (P) Krupp A.-G. Grusonwerk 658A
Clarifiers; Centrifugal —— (P) Del Valle 648A
Classifying. *See* Grading
Clay, acid; Acidity of Japanese ——. Kobayashi 655A
Coagulation of —— and protective action of humic acid. Odén 242A
Drying machines for ——. (P) Irwin and Knowles .. 214A
Extraction of alumina from ——. (P) Wildman .. 191A
Fusibility of mixtures of graphite ash and bond —— Long 628A
and the like, Mining or quarrying ——. (P) Osmosis Co., and Highfield 65A
Manufacture of alumina from ——. (P) Goldschmidt and others 820A*
Manufacture of aluminium sulphate, free from iron, from —— (P) Papierfabr. Köslin A.-G. 109A
Manufacture of crude sodium alum from ——. (P) Linkmeyer 64A
Manufacture of dry-pressed bricks from ——. (P) Chem. Lab. für Tonind. und Tonind.-Zeit. Seger und Kramer 784A
Moulding ——. (P) Allen 451A*
Osmotic purification of —— Ormandy 234A
Preparation of —— for shaping in the dry state. (P) Chem. Lab. f. Tonind. u. Tonind.-Zeit. Seger u. Kramer 690A
products, Kilns for burning —— (P) Webster .. 490A
Re-hydration of calcined —— Laird and Geller .. 24A
suspensions, Coagulation of —— Smith 423A
Testing —— for concrete aggregates. Fuller 491A
Treatment of ——: (P) Borchers 64A
(P) Feldenheimer 65A*
(P) Fleissner 722A
Treatment of —— and manufacture of articles and materials therefrom (P) Smith 658A
ware, Burning —— in tunnel kilns. (P) Harrop .. 450A
Clays in British Columbia 272R
Classification of —— on a ceramic basis Watts .. 490A
Relations between chemical composition, microscopic structure, and ceramic qualities of —— Bertrand and Languine 110A
Ultramicroscopical examination of ——. Alexander .. 628A
Cleaning compound. (P) Gorius and Hays 34A
material; Fibrous ——. (P) Reis und Co. .. 15A, 227A
by means of aluminium hydroxide. (P) Buchner .. 756A
and polishing powder from cellulose hydrate. (P) Slaight and others 16A*
process (P) Buchner 568A
(P) Horkenbach 376A, 459A
Clinker and the like; Plant for manufacture of ——. (P) Atkins and Colquhoun 599A*
Cloth, Action of atmospheric influences on —— Grass 481A
Kortess 481A
Wagner 512A
made from yarn treated with mineral oil, Washing —— (P) Pinagel, and Aachener Chem. Werke für Textilindustrie 154A
Clouds, artificial, Production of intense ——. (P) Weiss and Veidler 469A*
Clupea longiceps; Fatty oil of ——. Menon 93R
Cnicus Benedictus seeds; Fatty oil of ——. Ferenos .. 71A
Coal; Action of —— on a photographic plate. Sinkinson .. 357A
Agglutinant for conglomeration of ——. (P) Iranzuta 289A
Air-dried condition and hygroscopicity of fossil —— in relation to numerical value of calorific power. Kempf 620A
analysis. Sinnatt 538A
Apparatus for analysing or determining volatile constituents of ——. (P) Naito 642A
Apparatus for drying or coking ——. (P) Davis .. 436A
Apparatus for separating fine ——. (P) Draper .. 54A*
Apparatus for washing ——: (P) France 478A
(P) Habets and France 714A

Disodium perphosphate; Manufacture of ——. (P) Aschenasi 406A
Dissolution and peptisation of solids. Kohlschütter and Walther 25A
Dissolvers; Rapid ——. (P) Johnson 739A
Dissolving liquids or solutions insoluble in water. (P) Chem. Fabr. Flörsheim Noerdlinger 376A
Distillation apparatus. (P) Sleeper, and Buffalo Foundry and Machine Co. 2A
apparatus; Electrically heated ——. (P) Allgem. Elektrizitäts-Ges. 774A
apparatus; Evaporating and ——. (P) Duodo 740A*
apparatus; Rotary dry ——. (P) Ten Broeck and others 652A
apparatus for separation of water from organic solvents. Walker 426A
of asphalt rock, bituminous slate, etc; Furnaces for ——. (P) La Porta and De Bartolomeis 479A
of binary mixtures of immiscible liquids Masfaraud .. 299T
of carbonaceous material; Apparatus for ——. (P) Perry .. .. 511A, 566A (P) Wallace 743A*
of carbonaceous materials; Destructive ——. (P) Perkin, and Nitrogen Products and Carbide Co, Ltd. 8A
of carbonaceous materials, Heating of vertical retorts for ——. (P) West and others 813A
of carbonaceous materials, Retorts for ——. (P) West and others 741A
of coal, carbonaceous materials, oil shales, and the like. (P) Christopher 441A
of coal and other materials (P) Dressler Tunnel Ovens, Ltd, and Dressler 652A
of coal, shale, etc; Recovery of valuable products from gases evolved in destructive —— (P) Skinningrove Iron Co, and Bury 593A
column (P) Zimmermann und Jansen 436A
columns, Rings for filling —— (P) Lessing 321A
Connexion bulb for —— Clark 529A
and concentration columns for separating oils from mixtures (P) Maschinenbau A.-G. Golzern-Grimma 742A
Dehydration of liquid mixtures by —— (P) Kubierschky 480A
fractional; Apparatus for —— (P) Chenard .. .. .. 92A (P) Weirauch 398A
fractional, Brown's formula for —— applied to benzene-toluene mixtures. Young 262A
fractional, Continuous —— (P) O'Brien 355A
fractional; Continuous —— of crude benzol and the like (P) Soc Franco-Belge de Fours à Coke .. 100A
fractional, Continuous —— of petrol, petroleum, benzol, and the like (P) Barbet et Fils et Cie .. 56A
fractional —— of crude petroleum and other hydrocarbons (P) Von Groeling, and Atlas Process Co 182A
fractional; Method of maxima and minima in analysis by —— Moureu and others 584A
and fractionation of liquids, Apparatus for ——. (P) Allan 682A
and fractionation of mixtures of volatile liquids, Apparatus for, continuous —— (P) Allan 813A
of frothing liquids, Flask for fractional —— Leak 430A
of fuels and bituminous ores, Retort ovens for ——. (P) Hauser 327A
of fuel; Low-temperature —— (P) Merz and McLellan, and others 150A
gases *See under* Gases
in a high vacuum, Laboratory apparatus for ——. Houben 84A
or the like; Apparatus for —— (P) Emerson 810A
and like columns. (P) Gay 537A
of liquid hydrocarbons (P) Pershall 510A
of liquids; Continuous —— (P) Gibson 476A
low-temperature; Retorts and the like for —— (P) Merz and McLellan, and others 685A
Method of ——: (P) Hayes and Ray .. .. 440A (P) Newton 810A
of mineral oils, Evaporator for —— (P) Melschke-Smith, and Shell Co of California 182A
of oils; Apparatus for —— (P) Faust, and International Gasoline Process Corp 510A
of oils and other liquids (P) Bateman 272A
of organic materials, Dry —— (P) Aktiebolaget Cellulosa, and Magnuson 350A
of peat, lignite, sapropel, oil-shales, wood, etc (P) Francke 56A
of petroleum and the like (P) Cleveland Trust Co 7A*
of petroleum, tar, and the like, Preheaters for use in ——. (P) Steinschneider 261A*
plant for coal tar hydrocarbons and other like matters; Fractional —— (P) Edwards 328A
plant with special reference to rectification of alcohol, acetaldehyde, and other volatile products, and continuous ether manufacturing plant Masfaraud 163R, 299T
Process of destructive ——: (P) Stafford .. .. 397A (P) Turner 350A* 701A
and rectification. Gay 287A,
and rectifying apparatus. (P) Hübner 649A
residues; Cooling ——. (P) Zschocke 260A

arc soldering and depositing of metals; Electrodes for —.
(P) Jones 494A
(P) Jones, and Alloy Welding Processes, Ltd. 494A
arc treatment of air and gases (P) Friedrich .. 755A
arc welding, cutting, and repairing, using alternating current. (P) Holslag 373A*
arc welding and repairing. (P) Holslag 30A*
arcs; Arrangement of direct current —. (P) Lummer and others 183A
arcs; Automatic regulation of velocity with which air or gas or mixtures thereof enter or leave longitudinal channels in electrodes of — under the influence of increased or diminished pressure. (P) Mylo .. 150A
arcs employed in searchlights, projection apparatus, and arc lamps; Arrangement, formation, and coloration of —. (P) Mylo 150A
batteries:
(P) Crowley and others 271A
(P) French, and National Carbon Co. .. 824A
(P) Fuller and others 824A
(P) Ruhoff, and French Battery and Carbon Co 340A, 727A
(P) Sperry 32A
batteries; Depolarising agents for —. (P) Kell .. 197A
batteries; Electrolytic manufacture of higher oxide of manganese depolarising agent for —. (P) Ellis, and National Carbon Co. 71A
batteries; Envelopes for plates of — (P) Carpenter, and U S Light and Heat Corp 196A
batteries; Manufacture of densified depolarising agent for — (P) Ellis, and National Carbon Co .. 71A
batteries; Manufacture of double copper oxide plates for —. (P) Engle, and American Elementary Electric Co 824A*
batteries; Manufacture of negative plates for — (P) Pouchain 726A
batteries; Manufacture of oil-protected —. (P) Ruhoff, and French Battery and Carbon Co. .. 727A
batteries; Primary — (P) Ruhoff, and French Battery and Carbon Co. 340A
batteries; Primary — with unalterable electrolyte. (P) Jungner 373A
battery elements; Electrolytic production of zinc —. (P) Cowper-Coles 696A*
battery materials; Purification of —. (P) Ruhoff, and French Battery and Carbon Co. 550A
battery plates; Active material for — (P) Gardiner and Duggan 550A
cables; Alloys for armouring of —. (P) Stenquist 602A
cathode ray discharge tubes employing a high vacuum; Incandescence cathode for use in —. (P) Ges. für drahtlose Telegraphie 815A
cell; Depolarisation by oxygen of an —. Williams 285T
cell; Lead standard —. Mellon and Henderson .. 458A
cell; Metastability of the international Weston — and its unsuitability as a standard of electrical tension. Cohen and Moesveld 662A
cells:
(P) Evans 32A
(P) Féry 824A
cells; Depolariser for — (P) Harte 576A
cells; Electrolyte for high-temperature combustion —. (P) Siemens und Halske A.-G. 197A
cells; Manufacture of selenium —. (P) Hannach, and Böcker und Co. 197A
cells; New —. Pradel 789A
cells; Regenerating depolarisation masses from exhausted manganese dioxide —. (P) Klopstech 272A
cells; Wooden separator for — (P) Löffler .. 197A
coil; Artificially cooled, high-frequency — — for melting refractory material. (P) Northrup, and Ajax Metal Co 240A
currents; Transformation of polyphase — particularly for use in electric furnaces (P) Bibby 726A
currents; Vagrant — and other apparatus. Schaal 734A
discharge; Disappearance of gas in the —. Research Staff of General Electric Co. 776A
discharge tubes:
(P) Green and others 250A
(P) Siemens und Halske A.-G. 743A
discharge tubes; Cathodes for vapour filled or gas-filled —. (P) Germershausen and Partzsch 359A
discharge tubes; Electrodes for high vacuum —. (P) Müller 183A
discharge tubes; Incandescence cathodes for —:
(P) Germershausen 8A
(P) Shoupy 291A
discharge tubes and the like; Automatically removing gases from —. (P) General Electric Co. .. 480A
discharge tubes; Manufacture of electrodes for — from light metals. (P) Studien-Ges. für Elektrische Leuchtröhren 743A
dry cells. (P) Schrager, and Burgess Battery Co. .. 864A
dynamo-brushes; Material for —. (P) Becker Bros. 726A

furnaces. *See under* Furnaces.
incandescence lamps. (P) Siemens u. Halske .. 291A
incandescence lamps; Manufacture of —. (P) Harrison 776A*
incandescence lamps; Reducing dissipation of tungsten filaments in —. (P) Deutsche Gasglühlicht A.-G. 776A
lamp; New —. Schröter 183A
lamps; Filaments for —. (P) Westinghouse Lamp Co., and Hall .. .. .. U 99A
lamps; Leading-in conductors for —. (P) Anderson, and General Electric Co 291A
lamps; Mercury arc —. (P) Heræus 566A
lamps; Mercury vapour —. (P) Cornu 511A*
lamps; Production of filaments for —. (P) General Electric Co. 593A*
primary batteries; Manufacture of alkaline gelatinous electrolytes for —. (P) Engle, and American Elementary Electric Co. 824A*
primary cells and storage batteries; Manufacture of tubular electrodes for —. (P) Svenska Ackumulator Aktiebolaget Jungner 727A*
storage-battery plates, Treatment of —. (P) Martin, and Philadelphia Storage Battery Co. .. 416A
storage cells. (P) Fery 304A
transformers and switchboards; Incombustible or difficultly combustible insulating liquids for —. (P) Grossmann 340A
welding. *See under* Welding.

Electrical charge on diaphragms; Modifying the —. (P) Schwerin, and Elektro-Osmose A.-G. 162A*
classification of finely-divided material. (P) Schmidt, and International Precipitation Co. 393A
compounding of liquids with gases or other components, including carbonating of beverages. (P) Bloom .. 494A
conductivity of gases during chemical reactions; Constancy of —. Trautz and Hengstenberg .. 403A
conductivity of metals and alloys at high temperature, Measurement of —. Haughton 216R, 724A
conductivity of mixtures of fused and solid salts. Sandonnini 603A
conductivity of soda-lime silicate glass. Ambronn .. 295A
conductivity; Use of — for determining composition of alcohol-water mixtures. Kolthoff 203A
conductor; Producing an alteration of structure of an — by heating during winding (P) A.-G. Brown, Boveri, und Co. 458A
conductors; Leading-in —, *e.g.*, for electric lamps. (P) Anderson, and General Electric Co. 291A
conductors, Manufacture of impregnating material for fibrous insulating covering of —. (P) Bruggemann 633A
deposition of particles from gases. (P) Lodge, and Lodge Fume Co 711A
endosmose of molten sodium chloride into carbon. Ostwald 31A
energy, Transforming kinetic energy of gases into — and utilising latter for carrying out gas reactions (P) Petersen 696A
equipment at works of Ebbw Vale Steel, Iron, and Coal Co, Ltd Dixon 336R
heater for coal-tar naphtha distillation test. Hill and Chillas 397A
-heater resistance element (P) Gardner and others .. 494A
heater for vapours or conducting gases. (P) Allgem. Elektrizitäts-Ges. 356A
heating apparatus for liquids, Liquid-tight insulated joints for —. (P) Bellavitl 54A*
heating of insulating or inflammable liquids. (P) Allgem. Elektrizitäts-Ges. 340A
insulating liquids for transformers and switchboards, Incombustible or difficultly combustible — . (P) Grossmann 340A
insulating material from coumarone-resin. (P) Wells, and Fife-Foster Co 340A
insulating material, Plastic —. (P) Motta and others 340A
insulating moulded articles Manufacture of —. (P) Grünwald 272A
insulation (P) Elektro-Material ties. 494A
insulators, Manufacture of moulded —. (P) Westinghouse Electric and Manufacturing Co 374A
machines and transformers, Drying insulation for — (P) A. G. Brown, Boverie et Cie. 32A
mechanical filters, Continuous —. (P) Meston, and Research Corp 355A
power. *See under* Power
precipitating system. (P) Chubb, and Westinghouse Electrical and Manufacturing Co. 648A
precipitation apparatus, Electrodes for use in —. (P) Siemens-Schuckertwerke Ges. 393A
precipitation; Device for — employing high-tension current. (P) Siemens-Schuckertwerke Ges. .. 437A
precipitation of dust from gases; Apparatus for —. (P) Siemens-Schuckertwerke Ges 476A
precipitation of matter from gases. (P) Strong .. 93A
precipitation; Motion of droplets and particles in field of corona discharge in —. Townsend and Karrer 603A
precipitation of particles from gases. (P) Morris and Havilland 711A
precipitation plant; Removal of dust from settling surfaces of —. (P) Pfleiug 822A
precipitation of sulphuric acid fog and of dust. Dubrisay 780A

internal-combustion; Purification of exhaust gases from —— (P) Gasmotorenfabr. Deutz 715A
internal-combustion; Valve failures and valve steels in ——. Aitchison 326A
Enzyme action in *Echinodontium tinctorium*, a wood-destroying fungus Schmitz 66A
action; Mechanism of —— Yamazaki 636A
action; Urease, and radiation theory of ——. Barendrecht 555A
of soya beans. Wester 38A, 129A
Enzymes. Maestrini 38A
of *B. coli communis* which are concerned in decomposition of dextrose and mannitol. Grey 244A, 244A
Baths, mixtures, or the like containing —— for bating hides. (P) Rampichini & Co. 636A
Chemical nature of —— Bokorny 633A
Chemical studies on ——. Von Euler and Svanberg 700A
diastatic; Influence of neutral alkali salts on —— Hahn and Harpuder 245A
Distribution of —— in the endosperm of the wheat berry Martin 760A
of germinated barley. Maestrini 327T, 348T
in Gleditschia (black locust) seeds Krÿz 309A
Influence of aspartic acid and asparagin on hydrolysis of starch by ——. Sherman and Walker 240A
Influence of temperature on ——. König 37A
Lipolytic —— in olive oil. Rector 795A
in mould spores Kopeloff and Kopeloff 304A
Theory of action of —— by radiation Barendrecht 168A
in top yeast; Fermentation ——. Von Euler and Moberg 293A
of yeast. Bokorny 244A
Enzymic extract; Properties of a specially prepared —— and comparison of its starch-liquefying power with that of malt diastase Takamine, jun., and Oshima 202A
Ephedrine. Synthesis of inactive ——. Ebehard 524A
Ergot preparation. Manufacture of a highly-active —— (P) Chem. Fabr. vorm Sandoz 702A
Erythrene; Purification of ——. (P) Ostromisslensky 349A
Erythrohydroxyanthraquinone; Oxidative formation of 1 1'-dihydroxy-2.2'-dianthraquinonyl from ——. Scholl and others 83A
Esters of amino-acids, Preparation of —— Foreman 152A
Apparatus for manufacture of —— (P) Backhaus, and U.S. Industrial Alcohol Co 277A
Continuous manufacture of ——. (P) U.S. Industrial Alcohol Co. and Backhaus 801A
of ethylenic halogenhydrins, Manufacture of ——. (P) Soc. Chim. Usines du Rhône 674A
of fatty acids, Manufacture of —— (P) Meister, Lucius, und Brüning 247A
Manufacture of ——. (P) U.S. Industrial Alcohol Co. 206A
Manufacture of β-alkylaminoethylan'no-benzoic ——. (P) Soc. Chim. Usines du Rhône 43A, 350A*
Manufacture of ethylidene ——. (P) Chem. Fabr. Griesheim-Elektron 44A
Manufacture of β-halogenethylaminobenzoic —— (P) Soc. Chim. Usines du Rhône 43A, 350A*
Manufacture of substituted benzoic acid ——. (P) Soc. Chim. Usines du Rhône 43A
rosin-tung; Manufacture of —— and application in varnish manufacture. Gardner and Coleman 791A
Ethane; Latent heat of vaporisation of ——. Satterly and Patterson 539A
Ether absorbed in sulphuric acid; Recovery of ——. (P) Herrmann 765A
Action of —— on metallic mercury. Dott 349A
-air mixtures; Self-ignition of —— McClelland and Gill 704A
Apparatus for rectification of ——. (P) Maschinenbau-A.-G. Golsern-Grimma 385A
apparatus and vagrant electric currents. Schaal 734A
Continuous production of ——. (P) Barbet, and Barbet et Fils et Cie. 207A*

Ether —*continued*.
Elimination of danger of electrically charged ——. Holde 96A
Ignition of mixtures of air, alcohol, and —— in contact with heated surfaces. White and Price 95A
Industrial process for synthetic manufacture of —— from coal distillation gases. De Loisy 147A
Manufacture of ——. (P) Elektrizitätswerk Lonza 427A
Manufacture of —— from ethylene. (P) Damiens and others 833A
manufacturing plant; Distillation plant with special reference to continuous ——. Masfaraud 299T
Purification of ——. (P) Claessen 312A
vapours; Recovery of alcohol and —— contained in air of factories. (P) Barbet 145A*
Ethers; Catalytic preparation of —— by dry way. Mailhe and De Godon 247A, 466A
of starch and similar carbohydrates; Manufacture of alkyl ——. (P) Lilienfeld, and Chemical Foundation, Inc. 654A*
Ethyl acetate; Manufacture of —— from acetaldehyde. (P) Konsortium für Elektrochem. Ind. 83A
Manufacture of —— from paraldehyde. (P) Soc. des Aciéries et Forges de Firminy 527A
Synthetic manufacture of ——. (P) Pascal 385A
Use of —— as a precipitant for proteins. Marie 431A
Ethyl alcohol *See* Alcohol
Ethylation; Application of ethyl chloride for ——. Henning 2T
Ethylcellulose; Acetolysis of ——. Hess and Wittelsbach 512A
Ethyl chloride; Antiseptic action of ——. Salkowski 702A
Commercial production, properties, and technical applications of —— Henning 1T
Manufacture of mixtures of methyl chloride and —— for use as solvents for extraction purposes. (P) Henning 833A
Ethyl cinnamate Hydrogenation of ——. Armstrong and Hilditch 122T
Ethylene; Chlorination of —— in presence of calcium chloride Smythe 312A
Combination of bromine chloride with ——. Delépine and Ville 516A
Compression, storage, etc. of ——. (P) Backhaus, and U.S. Industrial Alcohol Co 479A
Gas analytical separation of acetylene, benzene, and ——. Treadwell and Tauber 4A
Manufacture of alcohol or ether from ——. (P) Damiens and others 833A
Manufacture of glycol from ——. (P) Chem. Fabr. Griesheim-Elektron 385A
Mechanism of reaction between sulphur chloride and ——. Conant and others 348A
Nitration of —— Wieland and Sakellarios 280A
present in coke-oven gas, Fixation of —— as alcohol and its derivatives. Bury 94A
Ethylene bromohydrin; Preparation and characterisation of —— Read and Hook 801A
Ethylene chlorhydrin; Preparation of —— from oil-gas. Brooks 384A
Ethylene dichloride; Preparation of ——. (P) Union Carbide Co. 135A*
Ethyleneglycol; Preparation of —— from oil-gas. Brooks 384A
Ethylene oxide; Manufacture of ——. (P) Badische Anilin und Soda Fabrik 582A
Ethylenic compounds, Factors controlling rate of hydrogenation of —— in presence of nickel. Armstrong and Hilditch 120T
Ethylidene diacetate; Manufacture of ——. (P) Boudet, and Soc. Chim. Usines du Rhône 734A
Ethylidene esters, Manufacture of ——. (P) Chem. Fabr. Griesheim-Elektron 44A
Ethylmorphine sulphate Thomson 133A
Ethyl sulphates; Manufacture of ——. (P) Curme, and Union Carbide Co 501A
Eucalyptol *See* Cineol.
Eucalyptus industry in Victoria 167R
oils *See under* Oils, Essential.
Eusol Method for accurate preparation of ——. Hart 79A
Strength of hypochlorous acid in solution, with particular reference to ——. McCrae 347A

So-called methyl alcohol ——. Von Lippmann .. 732A
of starch by *Bac. granulobacter pectinovorum*; Acetone and butyl alcohol ——. Speakman 881A
of starch; Gas production during acetone and butyl alcohol ——. Speakman 760A
of sugar factory waste water by yeast. Kraisy .. 420A
Sulphurous acid and yeast ——. Högglund 880A
tube for sugars etc.; Modified form of Smith ——. Fuller 636A
of yeast; Effect of organic and inorganic substances on ——. Masters and Maughan 796A
Yeast nutrition and ——. Bokorny 795A
of yeast; Rhythmic phenomena in growth and ——. Köhler 732A
Fermented liquor from ramoon nuts. (P) McKee 130A
Ferments; Destruction of ——. (P) Bechhold 881A
Ferns; Extraction of —— with dry and moist benzene under pressure. Fischer and Kleinstück 218A
Ferrates; Influence of superimposed alternating current on anodic formation of ——. Grube and Gmelin .. 863A
Ferric hydroxide; Carrying down of calcium and magnesium hydroxides by precipitates of ——. Toporescu .. 503A
oxide; Carrying down of copper oxide and nickel oxide by precipitates of ——. Toporescu 925A
oxide; Catalytic action of —— on sucrose. Thomas .. 87A
oxide; Hydrous ——. Weiser 781A
oxide; Manufacture of pure ——. (P) Hemingway .. 460A
salts; Oxidation of sulphurous acid by ——. Meyer .. 229A
salts; Recovery of iron from liquors containing ——. (P) Frischer 365A
sulphate, basic; Manufacture of ——. (P) McKaye, and River Smelting and Refining Co. 267A
Ferricyanides; Determination of ——. Kolthoff 61A
Ferro-alloys; Determination of carbon in ——. Rottmann 367A
Manufacture of ——
(P) Sulman and Ballantine 160A, 601A
(P) Turner 70A*
Ferro-aluminium; Electric smelting of bauxite for production of ——. (P) Rheinische Elektrowerke A.-G. 754A
Ferrocerium Hirsch 661A
Ferrochromium; Manufacture of ——. (P) Turner .. 603A*
Manufacture of low-carbon ——. (P) Sicard, and United States Ferro-Alloys Corp 548A
Ferrocyanides; Determination of ——. Kolthoff 61A
Electrometric determination of —— by means of change in oxidation potential. Kelley and Bohn .. 18A
Manufacture of ammonia and formates from ——. Heise and Foote 362A
Recovery of —— from spent oxide. Grube and Dulk .. 515A
Ferromanganese as a deoxidising agent. Jung 411A
Manufacture of potassium permanganate from —— by electrolysis Thompson 106A
Reducing pyrolusite to manganous oxide before use in production of high-percentage —— (P) Hub .. 661A
Saving of —— by use of fluorspar in open-hearth furnace practice. Goldmann 113A
Ferromolybdenum, Manufacture of —— at Orillia, Ontario. Lamble 492A
Ferro-nickel, Manufacture of carbon-free —— in a high-frequency induction furnace Wilson 659A
Ferrosilicon; Electric furnace reduction of garnet with production of ——. Thompson and Davenport .. 411A
Generation of hydrogen from sodium hydroxide solution and ——. Weaver 403A
Ferrosoferric oxide; Manufacture of —— suitable for aluminothermic use (P) Bredig and others 191A
Ferrotungsten; Determination of tungsten in ——. Löwy 158A
Ferrous compounds; Catalytic action of copper salts on oxidation of —— by air Maquenne and Demoussy 569A
perchlorate, Manufacture of pure, stable, technical ——. (P) Merck 267A
salts; Antitoxic properties of copper with respect to action of —— on plants Maquenne and Demoussy 606A
sulphide as indicator in acidimetry Houben .. 85A
zymophosphate. Schweizer 672A
Fertiliser industry in Canada 319R
industry in Japan 202R
New phosphate —— 275R
Use of molasses as ——. De Sornay 420A
Fertilisers: Artificial nitrogenous ——. Russell 5R
containing dicalcium phosphate; Manufacture of ——. (P) Sadtler 201A
containing nitrogen and phosphoric acid. (P) Norsk Hydro-Elektrisk Kvaelstofaktieselskab 344A
containing phosphoric acid and alkali nitrates; Manufacture of ——. (P) Reinau 579A
Determination of nitrate-nitrogen and nitrates in ——. Moore 579A
Effect of various —— on crop production. Jordan and Churchill 242A
Exportation of —— 186R
Furnace for manufacture of germ-free —— from faeces and other organic waste products. (P) Stettiner Chamotte-Fabr. vorm. Didier 496A
Gas-volumetric determination of ammoniacal, nitric, and organic nitrogen in mixed ——. Bakti .. 827A
Human urine and sulphite-cellulose waste lyes as ——. Bokorny 167A

Fertilisers—*continued*. PAGE
Investigations on —— at Rothamsted 859R
made from peat: Action of various ——. Tacke .. 75A
Manufacture of ——:
(P) Bohre 759A*
(P) Buck 275A
(P) Carothers and Baker 667A
(P) Earp-Thomas 126A
(P) Fjelsinger, and Norsk Hydro-Elektrisk Kvaelstofaktieselskab 498A
(P) Partington and Parker 759A, 828A*
(P) Philip 75A

sulphite-; Manufacture of —— and recovery of sulphur dioxide (P) Fagan and others 226A
vulcanised, Manufacture of —— (P) Clayton and others 331A*

Fibres, artificial; Manufacture of —— (P) Fuller .. 817A
artificial; Manufacture of —— from cellulose solutions (P) Schreiner 719A
bast; Reaction for differentiation of structure of ——. Haller 512A
bast; Retting of ——. Krais .. 11A, 816A
broom-; Improving ——. (P) Nessel-Anbau-Ges .. 330A
capable of being spun; Production of a tannin-like material and —— from hop bines (P) Reis 13A
Converting short brittle —— into a condition suitable for spinning (P) Declen 330A
Fourcroya gigantea —— in Brazil 239R
Machines for drying or carbonising ——. (P) Charlesworth 12A
Machines for treating ——. (P) Dudley 228A, 361A, 401A, 542A
Machines for treating articles such as —— with liquids. (P) Schmidt 226A
Manufacture of —— from flax. (P) Robinson .. 444A
for manufacture of pasteboard suitable for saturating with tar for roofings, linings, etc., Mechanical process for obtaining ——. (P) Kron .. 483A*
Manufacture of —— from plants. (P) Nessel-Anbau-Ges. 778A
nettle; Treatment of —— for textile purposes. (P) Nessel-Anbau-Ges. 778A
Obtaining —— from fibrous plants, particularly nettles. (P) Nessel-Anbau Ges. 13A
Obtaining —— from hop bark. (P) Dammer 59A

Fibres—*continued*. PAGE
Obtaining —— from plants. (P) Nessel-Anbau-Ges., and Hoermann 778A
Obtaining useful —— and other products from reeds. (P) Verwertung inländischer Produkte Ges. 185A
Obtaining valuable —— from rushes. (P) Deutsche Typha-Verwertungs-Ges. 185A
Process for making smooth, stiff, vegetable —— suitable for carding and spinning. (P) Böhm und Sohn 18A
for spinning; Mechanical treatment of ramie, flax, hemp, and like plants for production of ——. (P) Govaerts and Dreypondt 568A*
Substitute —— and their manipulation. Rasser .. 11A
suitable for spinning; Production of —— from rushes. (P) Deutsche Typha-Verwertungs-Ges. 226A
suitable for spinning, Treatment of broom with alkali for production of ——. Kempf 268A
Tensile strength of ——. Krais 329A
textile; Digestion of woody fibres with chlorine for production of ——. Waentig and Gierisch .. 817A
textile; Influence of atmospheric exposure on ——. Turner 512A
textile; Manufacture of ——:
(P) Verein der Spiritus-Fabrikanten in Deutschland 360A
(P) Wilke and Schorsch 226A
textile; Manufacture of fine —— from mulberry bark. (P) Mark 360A
textile; Manufacture of —— from broom. (P) Hammer 744A
textile; Manufacture of —— from hop bines. (P) Küchenmeister 482A
textile; Manufacture of —— from lupin stems. (P) Hoffmanns Stärkefabr. A.-G. 102A
textile; Manufacture of —— from *Malva crispa* and *Lavatera trimestris* (P) Hammer 360A
textile; Manufacture of —— from raw plants. (P) Nesselanbau Ges. 400A
textile; Manufacture of —— from straw. (P) Strauss 744A
textile; Manufacture of —— from straw, grasses, etc. (P) Wolf and Trommer 103A
textile; Manufacture of —— from straw and similar stem and bast fibres. (P) Geraer Jute-Spinnerei und Weberei A.-G. 330A
textile; Manufacture of —— from typha seeds. (P) Jata-Werk für pflanzliche Füllstoffe Ges. .. 360A
textile; Manufacture of —— from wood:
(P) Enge 444A
(P) Mutter 102A
textile; Manufacture of resinous substances of vegetable origin suitable for impregnating substitutes for ——. (P) Fuchs 241A
textile; Moistening or conditioning ——. (P) Smethurst 61A*
textile; Obtaining —— from bark of trees. (P) Kniebel 59A
textile; Obtaining —— from woody vegetable substances, such as nettle stalks, barks, etc. (P) Hammer 444A
Treating fibrous plants, *e.g.*, yucca, for recovery of ——. (P) Lochr 292A
Treatment of —— (P) Pickup and Wilson 653A
Utilisation of —— in Rhodesia 290R
Utilising willow or poplar bark for production of ——. (P) Kersting 59A
vegetable; Analysis of mixtures of wool and ——. Krais and Biltz 512A
vegetable, Economy of cellulose and caustic soda in isolation, purification, and bowking of ——. Freiberger 101A
vegetable; Elimination of nitrogen from —— in the bleaching process Higgins 16A
vegetable; Manufacture of ——. (P) Korselt .. 482A
vegetable; Obtaining —— for textile purposes. (P) Deutsche Faserstoff-Ges Fulda 778A
vegetable, Process for making —— lustrous. (P) Krais and Röhm 292A
vegetable; Scouring —— to accelerate and facilitate subsequent bleaching. (P) Watreinez .. 568A, 686A
vegetable, Treatment of ——. (P) Gillet et Fils, and Schwartz 513A, 541A, 542A, 654A

Fibrin; Hydrolysis of —— in presence of aldehydes. Holm and Gortner 346A

Fibrous cleaning or polishing material. (P) Reis und Co. .. 15A
material, Apparatus for scouring, dyeing, or otherwise treating with liquor ——. (P) Walker 720A*
material; Manufacture of —— for making paper, papier-maché, and the like. (P) Skinner 227A
material, Manufacture of textile ——. (P) Hofsté .. 541A, 595A*
material, Obtaining —— from *Typhaceæ*. (P) Hoering 568A
material from pea-pods. (P) Pöhler 185A
material for surgical dressings. (P) Von Kapff 513A
material, Treatment of vegetable ——. (P) McDaniel and Kimbell 653A
materials; Colouring ——:
(P) Dennison, and American Rubber Co. .. 362A
(P) Gibbons, and American Rubber Co. .. 362A
materials, Drying and carbonising machine for ——. (P) Allsop and others 185A
materials; Machines for dyeing, scouring, and washing ——. (P) Whitaker and Whitaker 484A
materials; Treatment of vegetable —— and production of detergents. (P) Amber Size and Chemical Co., and Weygang 59A

electric heating; Polyphase ——. (P) Armour Fertilizer Works 458A*
electric —— for heating ribbons and bars (P) Colby, and Westinghouse Electric and Manufacturing Co 726A
electric, High-frequency induction —— for preparation of carbon-free ferro-nickel Wilson .. 659A
electric induction —— (P) Unger, and General Electric Co. 196A, 755A*
electric; Manufacture of artificial abrasives in ——. Brockbank 41T
electric; Manufacture of iron in —— (P) Stock .. 450A
electric; Manufacture of manganese and its alloys in —— (P) Lenoir 118A*
electric; Means actuated by alternating electric current for controlling or operating —— or other mechanisms. (P) Reid, and International Nitrogen Co. 755A
Electric melting ——. (P) Harvey 457A*
Electric —— for melting non-ferrous metals and their alloys. Collins 115A
Electric —— for melting and refining steel (P) Fabbr. Ital. Automobili Torino 693A
Electric metallurgical ——
(P) Electro-Metals, Ltd., and Robertson .. 787A
(P) Louvrier 548A
(P) Moore 70A*
Electric —— for metals, ores, etc. (P) Morgan Crucible Co., and Speirs 575A
electric; Method of operating ——. (P) Trembour, and Ludium Electric Furnace Corp. 494A
Electric —— and method of operation (P) Groeger .. 375A
electric; Method of oxidising materials, *e.g.*, steel billets, in ——. (P) Mayer and Kennedy 726A
electric; Mounting of electrode arms in tilting ——. (P) Moore 494A*
electric muffle; Doors for tilting —— (P) Imbery .. 340A*
electric; Problems in smelting in ——. Holmgren .. 237A
electric; Raising and lowering electrodes of tilting ——. (P) Moore 494A*
electric; Recent developments of —— in Great Britain. Campbell 224T, 250R
Electric —— for reducing oxidised zinc concentrates by carbon. (P) Thomson 29A
electric; Regulator system for —— (P) Bouton, and Westinghouse Electric and Manufacturing Co. .. 631A*
Electric resistance ——. (P) Simon and Sarron .. 340A*
Electric resistance —— for treatment of zinc ores. Fukton 192A, 194A
electric; Rotary —— for continuously melting zinc dust. (P) Cornelius 725A
Electric rotary muffle ——. (P) August 696A
Electric smelting ——. (P) Hole 548A
Electric —— for smelting iron ores (P) Shipton .. 492A
electric smelting; Manufacture of electrodes of ——. (P) Olsen 269A
Electric steel hardening ——. (P) Wild and Barfield .. 724A
electric; Step induction regulator for ——. Short .. 378A

PAGE

Furnaces—continued.
electric; Suspension of electrodes in ——. (P) Norske Aktieselskab for Elektrokem. Ind. Norsk Ind.-Hypotekbank 824A
electric; Temperature control for ——. (P) General Electric Co. 521A
electric; Temperature regulator for ——. White and Adams 119A
electric; Three-phase ——. (P) Snyder, and Industrial Electric Furnace Co. 272A
electric; Transformation of polyphase currents for use in ——. (P) Bibby 726A
Electric —— for treatment of metals and refractory materials and tools or crucibles made thereof. (P) Marsh 414A
Electric —— for use as soaking pits in the steel industry Bailly 115A
Electric versus open-hearth —— in steel manufacture. Ballaid 237A
Electro-converter ——. (P) Sarron and Simon .. 70A*
Enamelling —— (P) Dupont 866A*
especially for manufacture of iron and steel (P) Corsalli 29A
Firebricks for ——. (P) Keillar 491A
Forced draught ——. (P) Mann, and Chemical Engineering and Wilton's Patent Furnace Co .. 683A*
Forced rotary-draught ——. (P) Gaskill 811A*
Galvanising ——. (P) Porath 549A
Gas ——
(P) McKee 821A
(P) South Metropolitan Gas Co., and Chandler 92A
Gas crucible ——. (P) Tréfols 414A
Gas-fired crucible —— (P) Gaunt, and Lawley, Ltd. 214A
Gas-fired —— of new type. Travers 627A
gas-fired ring, Firing at high temperatures in ——. (P) Schmelz 784A
Gas-fired roasting ——. (P) Donnersmarckhütte Oberschlesische Eisen- u Kohlenwerke A.-G .. 69A
Gas-producer —— (P) Underwood 437A
Gas-producer —— for heating gas retorts (P) Litwin . 775A
Glass —— *See under* Glass
Grouped direct-fired —— for ceramic material. (P) Herda 821A
for hardening high-speed steel and the like (P) Gush . 549A*
for hardening or tempering steel tools or for heating or annealing metals, glass, pottery, or the like. (P) August 302A
Heat-treating ——. (P) Kirk 809A
Heat-treating —— and discharging apparatus therefor (P) Parsons and others 740A*
for heat treatment (P) Fuller and Bedford .. 117A
for heat treatment of long articles (P) Smallwood . 696A*
for heat treatment of metal articles. (P) Hardy and others 602A
for heat treatment of metal articles in an atmosphere of coal gas. (P) Yates and others 493A*
for heat treatment of metal bars etc (P) Fuller and Bedford 416A*
for heat treatment of metallic or other bodies. (P) Atkinson, and Stein and Atkinson, Ltd 576A*
for heat treatment of metals ——:
(P) Brighten and Peakman 302A
(P) Cunningham, and Stein and Atkinson, Ltd 339A*
(P) Gaunt and others 696A*
for heat treatment of steel, iron, or the like. (P) August 753A
Heating ——:
(P) Buell, and Tate-Jones and Co 563A
(P) Buell and others 563A
(P) Gray and others 1A
(P) Trinks, and Tate-Jones and Co., Inc. 507A
for heating liquids. (P) Wellman, and Kansas City Gasoline Co 440A
for heating metal articles. (P) Aktiebolaget Svenska Kullagerfabriken 493A*
for heating metal articles and the like (P) Southorne 631A*
for heating metal blooms; Slide tracks for ——. (P) Mathy 271A*
for heating metals (P) Williams and Ahlen 413A
for heating steel ingots (P) Koller 29A
Improvements in technique of firing of ——, with special reference to open-hearth furnaces Tafel .. 26A
and iron alloy lining therefor. (P) Copland, and Elyria Iron and Steel Co 507A
Lids for melting ——. (P) A.-G. Brown, Boveri, & Co. 339A*, 549A*
or the like; Burners for firing ——. (P) Atkins and Colquhoun 599A*
or the like; Device for emptying the contents of bins into —— (P) Sulzer Frères 356A*
for manufacture of aluminium nitride. (P) Herman .. 570A
for manufacture of germ-free fertiliser from fæces and other organic waste products. (P) Stettiner Chamotte-Fabr. vorm. Didier 498A
Martin; Heating —— with cold coke-oven gas. Springorum 299A
Martin; Operation of tilting —— using a mixture of low-grade and high-grade gas. (P) Deutsch-Luxemburgische Bergwerks- u Hütten-A.-G., and Klinkenberg 69A
Martin; Substituting coke or the like for pig iron in operating ——. (P) Thyssen und Co., and Thomas 803A
Means for consuming smoke in ——. (P) Halt 356A*
Means for facilitating repair of metallurgical and like ——
(P) Hardy 416A*

PAGE

Furnaces—*continued.*
Mechanical ——. (P) Ramén .. .. 740A•
for melting glass and other purposes (P) Shaw and others 573A
for melting metals. (P) Harvey 117A
for melting and refining metals. (P) Cohen and Catterall 694A
Metal smelting ——. (P) Sinclair 413A
Metallurgical ——:
(P) Griffiths 694A
(P) Howell .. .. 457A, 603A•
metallurgical; Heat regenerator for ——. (P) Skinner 661A
metallurgical; Heating —— with heavy oil. Gouvy .. 299A
metallurgical; Lining of ——. (P) Ely .. 162A•
metallurgical; Port construction for ——. (P) Downs, and Miller, jun. 548A
Metallurgical tilting ——. (P) Aubert .. 725A•
Method of charging reverberatory ——. (P) Charles .. 725A
Method of heating ——. (P) Renner 321A
Muffle ——
(P) Amsler 507A
(P) Hutchins .. .. 145A•
(P) Zetzsche 1A
muffle; Method of heating ——. (P) Zieren 437A
Muffle and semi-muffle and like ——. (P) Priest .. 619A
for nitrogen fixation
(P) Crowell, jun., and Nitrogen Products Co . 21A
(P) Hidden, and Nitrogen Products Co . 657A
for oil-cracking stills (P) Wellman, and Kansas City Gasoline Co. 221A
oil-fired; Burners for ——. (P) Woolley .. .. 774A•
Oil-fired —— for melting glass and other fusible substances. (P) Mohn .. .. 491A•
Oil-fuel burners for ——. (P) Simpson and Sons (Bolts and Nuts), and Everton .. .. 145A•
Open-hearth ——
(P) Carter and McLain .. .. .. 392A, 803A•
(P) Cromwell and Mehlhorn 457A
(P) Griggs .. .. .. 304A•, 725A•
(P) McKune 493A
(P) Waring and Waring 413A
open-hearth steel, Heating basic —— with a mixture of producer gas and coke-oven gas Schneider .. 410A
Operation of ——. (P) Siegwart and others 809A
Pot —— (P) Knoedler, and Welsbach Co. 647A
Producer-gas —— (P) Bildt 321A
for producing hot air for drying and other purposes (P) Schlatter, Frorath, & Co 1A
for production of mineral distillates of definite composition (P) Fadden 413A
for production of sulphates from bisulphates (P) Verein Chem Fabr in Mannheim 783A
Pyrites ——. (P) Bracq .. .. 365A•
Recovery of combustible material contained in ashes from industrial —— (P) André 715A
Recuperative —— (P) Smallwood .. 739A, 739A, 809A
Recuperative —— of new type Rosenhain and Coad-Pryor 213A
Recuperators or regenerators for ——. (P) Chantraine 564A•
Refuse destructor —— (P) Brechot 278A
Regenerative —— (P) Hurez .. .. .. 327A•
Regenerative soaking-pit —— (P) Stein, and Stein et Cie .. .. 602A•
Retort —— for recovery of zinc by reduction of zinc oxide (P) Burstizky 69A
Reverberatory —— for melting metals and alloys (P) Wüst 270A
Reverberatory —— for smelting steel and other metals of high melting point (P) Schmid 269A
Reverberatory —— for use with liquid fuel (P) Strub 563A
Reversible gas-heated —— (P) Rennison 214A
Ring ——
(P) Broadwell, and Aluminium Co of America 256A
(P) Doerschuk, and Aluminium Co of America 256A
Roasting ——
(P) Allinder, and Allis-Chalmers Manufacturing Co 302A
(P) Fouarge .. .. 373A•
for roasting blende, pyrites, or other minerals Rotary ——. (P) Bingham, and Huntington, Heberlein, and Co .. .. 314•
for roasting electrodes and pulverulent materials in crucibles or moulds (P) Meiser 576A
roasting; Gas-fired —— (P) Donnersmarckhütte Oberschlesische Eisen- und Kohlenwerke A.-G. 457A, 575A
for roasting ores (P) Bracq .. .. .. 823A•
for roasting ores; Mechanical —— (P) Huntington, Heberlein, and Co., and Bingham 270A
Roasting —— for sulphurous ores. (P) Soc Anon de Vedrin, and Marcotty 270A
rotary; Composite lining for ——. (P) Rockwell, and Rockwell Co. 321A
rotary; Driving mechanism for ——. (P) Summers and Whittard .. .. 588A•
Rotary grates for ——. (P) Trétois .. .. .. 814A•
Rotary muffle ——. (P) August 590A
rotary; Sectional lining for ——. (P) Rockwell, and Rockwell Co. 256A
rotary; Treatment of lime mud in ——. (P) Polysius 22A
Selection of refractories for industrial ——. Rochow .. 111A
shaft-; Blast-proof closing of discharging devices for ——. (P) Stehmann .. .. 774A•
Shaft —— for burning lime, dolomite, etc., with built-in gas producers. (P) Skutalla 256A

Furnaces—*continued.*
Shaft —— for burning powdered limestone. (P) Müller 821A
Shaft —— and gas producers. (P) Chaudière 179A
Shaft —— for synthetic production of high-grade foundry and pig-iron. (P) Rombacher Hüttenwerk, and others 68A
shaft-; Utilisation of waste heat from ——. (P) A.-G. für Zinkind. vorm. Grillo 809A
Siemens-Martin —— with built-in gas producer. (P) Ostendorf 29A
Smelting ——
(P) Gaunt and Brookfield .. .. .. 576A•
(P) Jones, and U.S. Smelting Furnace Co. .. 373A
(P) Ward, and Independent Mines Smelting Co. 631A
(P) Ward and others 694A
Smelting —— heated by oil or gas. (P) Schmidt .. 823A
smelting, Open-side water-jacket for ——. (P) Carstens, and American Metal Co. 302A
smelting, Regenerators for —— (P) Kühn .. 602A
for steam boilers, kilns, and the like (P) Nash .. 256A
Steel-making and like ——. (P) Wellman, Seaver, and Head, Ltd., and Gray 161A
Steel smelting ——. (P) Fuller, and Fuller Engineering Co. 238A
Tilting crucible or melting pot ——. (P) Soc. des Alliages et Bronzes Forgeable 338A, 413A
for tinning and like operations. (P) Harper, Sons, and Bean, Ltd., and Conroy .. .. 631A•
Tunnel —— (P) Bigot 590A
Tunnel —— for electrodes and similar materials. (P) Meiser 755A
tunnel muffle; Heating of ——. (P) Schärtler .. 821A
Water-cooled inlets of ore reducing and refining ——. (P) Charles .. .. 631A•
Furs; Electrical process and apparatus for dyeing ——. (P) Bloom 484A
Fusain and coal dust Sinnatt and others 438A
Fused products; Apparatus for obtaining material in a state of division from —— (P) Minton, and United Alkali Co 448A
Fusel oil; Composition of ——. Luce 636A
Fustic, Differentiation of extract of old —— and quercitron extract Justin-Mueller 816A

G

Gadolinium Meyer and Müller 333A
Galactose, Fermentation of —— by *Lactobacillus pentoaceticus*, n. sp. Peterson and others 607A
m-Tolylhydrazone of ——. Van der Haar 244A
Gall, red pea-, Colouring matter of ——. Nierenstein .. 101A
Gallic acid, Derivatives of —— Alimchandani and Meldrum 703A
Manufacture of ——. (P) Nitritfabr A.-G. 349A
Gallium-cadmium alloy, Use of —— in electric vapour lamps 287R
Gallorubrones, a new group of red plant pigments. Nierenstein 101A
Galls; Manufacture of stable detergents from animal ——. (P) Lietz 806A
Galvanic batteries and cells *See under* Electric.
Galvanised iron; Deterioration of —— by smoke. Wisliceus 692A
iron; Pigments for primers for ——. Gardner .. 121A
iron; Recovery of zinc oxide by treatment of —— in the open-hearth furnace. Müller 693A
steel, Metallographic study of ——. Taji 368A
Galvanising furnace. (P) Porath 549A
Preparing metals for ——. (P) Harmeling and Fay .. 338A
Gambia, Trade of —— in 1918 .. .. .. 311R
Gambier catechin; Constitution of ——. Freudenberg .. 729A
Garbage; Animal foodstuffs from ——. (P) Goe 170A
Treatment of —— and production of carbon dioxide therefrom (P) Danks 40A
Garnet; Electric furnace reduction of —— with production of ferro-silicon Thompson and Davenport 411A
Gas analysing and recording apparatus:
(P) Brown and Pickston .. .. .. 708A•
(P) Cunningham 708A
analysis; Absorbent for heavy hydrocarbons in ——. Piechota 768A
analysis; Absorption apparatus for ——. (P) Boulton 210A
analysis apparatus
Bürgerhausen 45A
(P) Rohde, and Svenska Aktiebolaget Mono .. 643A•
(P) Weuer, and Svenska Aktiebolaget Mono .. 176A•
analysis apparatus accurate to 0·001% mainly designed for respiratory exchange work. Krogh 619A
analysis; Application of interferometer to ——. Edwards 138A
analysis; Automatic methods of —— depending on thermal conductivity. Weaver and others 470A
analysis; Combustion apparatus for use in ——. Weaver and Ledig 531A
analysis; Exact methods of ——. Ott 803A

analysis; Improved Orsat apparatus for ——. Jones and Neumeister 138A
analysis; Preparation of a hydrochloric acid solution of chromous chloride for use in ——. Krauskopf and Purdy 316A
analysis; Weight burette for ——. Weaver and Ledig 584A
Apparatus for manufacture of ——:
(P) Campbell 622A
(P) Wilcox 326A
Apparatus for manufacture of combined coal- and water- ——. (P) Wilcox 6A
Apparatus for producing combustible ——. (P) Pickard and Dobson 6A
for balloons. (P) Bayer und Co. 221A
blast-furnace; Apparatus for cooling of ——. (P) Weyman 195A
blast-furnace; Cleaning of ——:
(P) Turnbull 479A
(P) Weyman 221A
blast-furnace; More economical utilisation of —— for heating and power. Hewson and Fowles 211T
blast-furnace; Production of power from ——. Fowles 371A
blast-furnace; Rough cleaning of —— by the Lodge electro-static process. Hutchinson and Bury 336R, 751A
from blast-furnaces, gas-generating plants, and the like; Apparatus for washing and drying ——. (P) Hickman 813A
burner; Study of inverted incandescence ——. Killing 540A
-calorimeter. (P) Laird and Doherty 769A
-cleaning device. (P) Keith and Bain 358A
coal-; Apparatus for complete extraction of naphthalene from ——. (P) Marbaix and Deguide 742A
coal-; Apparatus for washing and scrubbing —— and the like (P) Brockway 592A
coal-; Calorific valuation of —— 381R
coal-; Composition of unsaturated hydrocarbons present in ——. Sinnatt and Slater 53R, 288A
coal-; Estimation of acetylene in ——. Arnold and others 509A
coal-; Furnaces for heat treatment of metal articles in an atmosphere of ——. (P) Yates and others .. 493A*
coal-; Industrial process for synthetic manufacture of alcohol or ether from —— De Loisy 147A
coal-; Influence of carburetting of —— on crystallisation of naphthalene in the mains Ab-der-Halden 219A
coal-; Manufacture of ammonium sulphate from ——. (P) Francke 191A
coal-; Obtaining free sulphuric acid from —— (P) Behrens 20A
coal-; Oxide purification of ——. Weyman 219A
coal-; Purification of — from sulphur compounds (P) Berk and Co., and Hood 510A
coal-; Recovery of ammonia from —— (P) Torrey, jun., and Semet-Solvay Co 651A
coal-; Recovery of ammonium chloride from ——. (P) Mueller 593A
coal-; Recovery of benzene hydrocarbons from ——. (P) Darler 396A*
coal-; Recovery of cyanogen compounds from ——. (P) Hood 715A
coal-; Treatment of —— and removal of substances contained therein (P) Pennington and Lamb .. 56A
coke-oven; Alcohol from —— 308R
coke-oven; Chloroform from ——. Dey 349A
coke-oven; Feld process for manufacture of ammonium sulphate from ——. Raschig 818A
coke-oven; Fixation of ethylene present in —— as alcohol and its derivatives Bury 94A
coke-oven; Determination of benzol in —— Shuttleworth 367A
coke-oven; Heating a Martin furnace with cold ——. Springorum 299A
coke-oven; More economical utilisation of —— for heating and power. Hewson and Fowles 211T
coke-oven; Recovery of ammonia from ——:
(P) Soc. Franco-Belge de Fours à Coke .. 814A*
(P) Soc. Ind. de Prod. Chim. 741A
coke-oven; Recovery of ammonium and sodium sulphates from ——. (P) Soc. Ind. de Prod. Chim. .. 516A
Coke-oven —— for town supply Wright 214T
Comparison of methods for producing tar and —— from lignite. Holzwarth 683A
condensers. (P) Ryffel 589A
for cutting and welding purposes. (P) Harris and Rose 221A
cylinders; Sale of Government —— 100R
Determination of tar in ——. Stone and Prince .. 591A

from anthracite and petroleum coke in manufacture of carbon electrodes; Treatment of ——. (P) Meiser 480A
Apparatus for absorbing —— from a gaseous mixture. (P) General Chemical Co., and De Jahn 589A
Apparatus for bringing about and controlling reactions between ——. (P) Conover 93A
Apparatus for cleaning ——:
(P) Hewitt and Steinbart 563A
(P) McGee 326A
(P) Wells 742A
Apparatus for condensing and purifying ——. (P) Rosenthal 20A
Apparatus for cooling ——:
(P) Hechenbleckner, and Chemical Construction Co. 323A
(P) Reavell, and Kestner Evaporator and Engineering Co. 392A
Apparatus for cooling and scrubbing ——. (P) Hunt and Fogg 260A
Apparatus for determining soluble constituents of ——. (P) Sperr, jun., and others 283A
Apparatus for effecting contact between liquids and ——:
(P) Darier 179A*
(P) Zimmermann, and Buhl Co 648A
Apparatus for electrical precipitation of dust from ——. (P) Siemens-Schuckertwerke Ges 476A
Apparatus for electrical purification of ——. (P) Siemens-Schuckertwerke Ges . 355A, 619A, 620A
Apparatus for electrical separation of substances in suspension in ——
(P) Gallot et Cie, and Poussin, Rondeaux, et Cie 196A
(P) Gallot and others 324A*
Apparatus for electrical treatment of ——
(P) Bradley, and Research Corporation . 93A
(P) Davidson, and International Precipitation Co 355A
(P) Hedberg, and Research Corporation 32A
(P) Squires, and Research Corp . 550A
Apparatus for electrical treatment of liquids with —— (P) Greenawalt 727A
Apparatus for filtering or otherwise treating ——. (P) Heenan and Froude, Ltd., and Cruyt . 1A
Apparatus for intensifying the mutual action one on another during mixing of —— with liquids or solids (P) Soc Anon l'Oxhydrique Francaise. 711A
Apparatus for measuring charges of ——, *e.g.*, for sterilising water (P) Menzies and Magrath 80A
Apparatus for measuring rate of flow of —— Erlich 766A
Apparatus for purifying —— (P) Smith, and Smith Gas Engineering Co 650A
Apparatus for removing and reclaiming solids from ——
(P) Sweetland, and United Filters Corporation . 1A
Apparatus for separating suspended matter from ——
(P) Schmidt, and International Precipitation Co 538A
(P) Schmidt and others .. 538A
Apparatus for subjecting —— to the action of liquid in the form of spray (P) Fowler . . 475A
Apparatus for treating —— (P) Yardley 54A*
Apparatus for treating and cooling —— (P) Heenan and Froude, Ltd., and Cruyt . . 1A
Apparatus for treating liquids with —— (P) Sieck, jun., and Drucker 302A
Apparatus for treating —— with liquids
(P) Frischer and Drees 774A
(P) Walker, and Heenan and Froude, Ltd 740A*
Apparatus for treating —— with liquids or *vice versâ* (P) Bulgin and others . . 475A
Apparatus for washing and absorbing —— (P) Steinmann 440A
Application of thermal conductivity method to automatic analysis of complex mixtures of —— Weaver and Palmer 706A
asphyxiating; Chemical properties of humus and their utilisation for protection of combatants against —— Griffon du Bellay and Houdard .. 205A
Automatic means for neutralising ——. (P) Bergfeld 53A
Behaviour of explosive mixtures of —— at low pressures Stavenhagen and Schuchard 812A
burner; Purifying —— and manufacture of briquetting material (P) Briggs, and General Chemical Co 544A
Catalytic combination of —— (P) Henwood 596A
chimney; Apparatus for cooling —— (P) Eckmann 258A
Cleaning —— (P) Mofice 479A
Cleaning of blast-furnace and like ——. (P) Weyman 221A
Collecting electrodes for electrical purification of hot dust-laden —— (P) Puning 196A
Combinations of pyramidal surfaces for purification of ——. (P) Gaillet. 435A
combustible; Chemical properties of humus and their utilisation for protection of combatants against —— Griffon du Bellay and Houdard .. 205A
combustible; Micro-analytical determination of carbon dioxide, oxygen, and ——. Schmit-Jensen 816A
combustible; Testing for ——. (P) Lamb and Larnop 47A
compressed; Purification of —— *for* laboratory purposes. Moser 333A
Compressing ——. (P) Melms u. Pfenninger Kommanditges., and Gansheimer 53A
Constancy of electrical conductivity of —— during chemical reactions. Travis and Hengstenberg .. 403A
containing hydrogen sulphide and ammonia; Conversion of thionate solutions containing sulphite and bisulphite obtained by washing —— with polythionate solutions, into pure thionate solutions. (P) Feld 191A

Gases—*continued*. PAGE

Cooling and liquefying ——. (P) Jefferies and Norton 619A
Cooling —— previous to liquefaction. (P) Chem. Fabr. Griesheim-Elektron 740A
Counter-current apparatus with internal expansion engine for liquefaction of ——. (P) Mewes .. 649A
Deodorising foul waste ——. (P) Neil 638A
Desiccating ——. (P) Claude, and L'Air Liquide .. 54A*
Determination of ignition temperatures of —— by the soap-bubble method. White and Price 54A
dissolved in liquids; Porous charges for containers for storage of explosive ——. (P) Pintsch A.-G. .. 684A
from distillation of coal. Vignon 591A
distillation; Direct recovery of ammonia from ——. (P) Piette, and Soc. Franco-Belge de Fours à Coke 814A*
distillation; Purification of ——. (P) Claclet and Deguide 652A*
distillation; Recovery of ammonia from ——. (P) Gebr. Hinselmann 622A
Effect of pressure on adsorption of —— by charcoal. Pickles 543A
Effecting intimate contact between liquids and gases for evaporating, cooling, concentrating, washing, and other purposes (P) La Bour 718A*
Electrical compounding of liquids with ——. (P) Bloom 494A
Electrical deposition of particles from —— (P) Lodge, and Lodge Fume Co . . 711A, 740A*
Electrical heater for conducting —— (P) Allgem. Elektrizitäts-Ges. 356A
Electrical precipitation of matter from —— (P) Strong 93A
Electrical precipitation of particles from —— (P) Morris and Haviland 711A
Electrical precipitation of suspended matter from ——
(P) Nesbit, and International Precipitation Co 810A
(P) Wolcott, and International Precipitation Co. 321A
Electrical precipitation of suspended material from furnace —— (P) Wolcott, and International Precipitation Co 257A
Electrical purification of —— (P) Puning . 257A
Electrical purification of dusty —— (P) Puning 355A
Electrical separation of suspended material from ——
(P) International Precipitation Co . 324A*
(P) Schmidt, and International Precipitation Co 476A
Electrical treatment of ——
(P) Bradley, and Research Corporation 217A*, 355A

Determination of the tensile strength of ——. Hopp .. 378A
Isonelies; Testing the strength of —— Low 378A
Isonely strength of ——. Sheppard and others 758A
Isoning; Influence of method of manufacture on use of casein in ——. Butterman 274A
Manufacture of bone or hide —— which remains liquid in the cold. (P) Luftfahrzeugbau Schütte-Lanz .. 827A
Manufacture of feeding-stuff, fat, and —— from bones. (P) Goslar 738A
manufacture in New South Wales 445R
Manufacture of —— in the tropics from tannery refuse. Srinivasan 123A
Manufacture of water-resistant ——. (P) Grünewald .. 497A
Properties and constitution of ——. Bogue 605A
solutions; Apparatus for concentration of ——. (P) Goslar-Apparatebau Samstag und Co. 758A
substitute; Manufacture of ——. (P) Bayer und Co. .. 578A
Isoglutamic acid and its salts; Decomposition of —— on heating. Skola 673A
Isoluten; Colloid chemistry of rye and wheat gliadins, with special attention to —— Liers 499A
Determination of dry —— in flour Bouyer 204A
Determination of wet —— in low-grade flours Bouyer 276A
Manufacture of a colloidal solution, neutral to the taste, from ——. (P) N. V. Jurgens Vereenigde Fabr. .. 204A
Separating starch from ——. (P) Conte 461A
Isolutin; Benzene derivatives in ——. Salkowski 698A
Isolycerides; Function of catalyst in addition of hydrogen to unsaturated —— Thomas 12T
Mechanism of addition of hydrogen to unsaturated glycerides in presence of finely divided nickel Thomas 10T, 10R
Synthesis of α-mono- ——. Fischer and others .. 790A
α-Isolycerides; Application of acetoneglycerol to preparation of pure ——. Fischer and Pfähler 790A
Isolycerin; Determination of trimethyleneglycol in distilled dynamite —— and in first runnings. Rojahn .. 314A
Exports of —— from U.S.A. 312R
Manufacture of ——. Verbeek 790A
Obtaining pure —— from liquids containing it. (P) Bayer und Co. 121A, 121A
Obtaining —— from soap lyes. (P) Blum and Francke 306A
solutions; Obtaining concentrated —— from dilute, highly impure solutions. (P) Löffl 240A
Splitting fats and oils for manufacture of fatty acids and ——. (P) Twitchell Process Co 697A*
substitute; Phthalic acid ester salts as ——. (P) Rössler 44A
substitutes; Alkali lactates as ——. Neuberg and Reinfurth 801A
substitutes from lactates. (P) Chem. Fabr. Goldenberg, Geromont, und Co. 756A
U.S. foreign trade in —— 22R
Isolycerol; Bacterial decomposition of —— in wine. Müller-Thurgau and Osterwalder 345A
Correlative formation of acetaldehyde and —— by scission of sugar. Neuberg and Reinfurth 76A
formation in alcoholic fermentation; Natural and artificial ——. Neuberg and Reinfurth 168A
Influence of presence of trimethyleneglycol on estimation of fermentation ——. Rojahn 77A
Manufacture of pure —— from liquids containing it or from crude glycerin. (P) Elektro-Osmose A.-G. .. 756A
Manufacture of —— from sugar. (P) Ver. Chem Werke A.-G. 608A, 670A, 830A
Mechanism of "fixation" method of decomposition of sugar into acetaldehyde and ——. Neuberg and Hirsch 38A
in wines. Mathieu 669A
Isolycerol β-monochlorhydrin. Smith 674A
Isolycerophosphatase of seeds. Nemec 244A
Isolycerophosphate solutions; Conversion of —— into a crystalline preparation. (P) Bergell 802A
Isolycerophosphates; Detection of inorganic phosphate in ——. Lintner 266R, 610A
Isolycocholic acid in kephalin. Levene and Bass 138A
Isolycocoll; Production of complex silver salts of —— (P) 640A
Isolycol; Compound of phosphoric acid and ——. (P) Bayer and Pfähler 220A
Determination of ——. Müller 138A
Manufacture of —— from ethylene. (P) Chem. Fabr. Griesheim-Elektron 254A
Isolycols; Preparation of ethylene- and propylene- —— from oil-gas. Brooks 344R
Isolyoxal; Manufacture of ——: (P) Boeshard 765A
(P) Wohl and Bräunig 765A
Preparation of —— by action of ozone on acetylene. Wohl and Bräunig 275A
Isolyoxaline nucleus; Some properties of and dyestuffs containing the ——. Pyman 430A
Isold alloy; Manufacture of a white ——. (P) Belsis 270A, 418A*
-copper alloys; Hardness and resilience of ——. Portevin and Durand 412A
Electro-deposition of —— from cyanide solutions. Christy 337A
foil; Production of transparent and opaque enamels on wrought iron (sheet iron) by means of layers of ——. (P) Fix und Schmidt 491A
Growth phenomena of ——. Beutell 200A
Microchemical detection of ——: Bayer 721A
Emich 721A
New methods in hydrometallurgy of ——. Freeman .. 98
ore; An unusual process in treatment of ——. Gardiner 290A
output of Transvaal 218R
production in Federated Malay States 154R
production in Germany; Possibility of —— 288R
Production of radium and —— by decomposition of mercury. (P) Perez 455A
Recovery of ——. (P) Thayer 118A
-silicon alloys. Di Capua 370A
-silver alloys; Action of *aqua regia* on —— in presence of ammonium salts. Pollard 299A
sols; Coagulation of ——. Westgren 117A
Isold Coast Colony; Trade of —— in 1918 .. .. 380R
Isold Coast Northern Territories; Trade of —— in 1918 .. 99R
Isovernment laboratory. *See under* Laboratory.
orders and notices; Various ——. 19R, 41R, 61R, 82R, 117R, 137R, 152R, 172R, 190R, 206R, 240R, 262R, 309R, 330R, 364R, 387R, 404R. 420R
Israding apparatus for minerals and the like. (P) Richardson 576A*
crushed rock and other materials; Separators for ——. (P) Sturtevant 477A*
of finely-divided material; Electrical ——. (P) Schmidt, and International Precipitation Co. .. 393A
ores or the like. (P) Gasche 457A*
Israin; Converting —— into paste or dough. (P) Points .. 525A
Disintegrating and extracting liquid from ——. (P) Meizer 565A
Steeping and malting ——. (P) Rummel 524A
Isranulating pasty or semi-fluid materials; Apparatus for finely dividing or ——. (P) MacLachlan 30A
Isrape must; Determination of minute quantities of iron in —— Mathieu 431A
seed; Possibility of commercial utilisation of ——. Shrader 131A
Israphite in 1918 .. .. 78R
articles; Manufacture of —— (P) Linbarger, and Carborundum Co. 450A
ash and bond clays; Fusibility of mixtures of ——. Long 628A
Defloculating —— (P) Acheson 564A
electrodes, especially suitable for searchlights. (P) Conradty 251A
Enclosing pieces of —— in refractory metals. (P) Ising and Borofski 303A, 356R
industry of Canada Spence 233A
Manufacture of flake —— from kish. (P) Osgood and Kenner 233A
Moulding ——. (P) Allen 451A
obtained from cast iron; Crystalline nature of —— Iokibe 785A
plate heated electrically to a high temperature; Luminous phenomena observed in neighbourhood of —— Hemsalech 21
production in German Austria 188
Purification of natural ——. (P) Ridout, and Soc. Talco e Grafiti Val Chisone 22
situation in Ceylon 22
situation in Madagascar 31
in Western Australia 29

Hemicelluloses; Manufacture of —— from wood by the soda process. (P) Kittelsen and Kittelsen 779A
Hemp fibres; Differentiation of flax and ——. Haller 292A
Manufacture of imitation ——. (P) Nishimura and Honda 444A, 686A*
Proximate composition of Korean ——. Uyeda 541A
straw; Treatment of ——. (P) Püschel 13A

Henna; Constitution of colouring matter of ——. Tommasi 594A

Heterocyclic organic compounds; Manufacture of ——. (P) Wierzik and others 44A

Hevea rubber. *See under* Rubber.

Hexamethylenetetramine; Preparation of derivatives of ——. (P) Riedel A.-G. 765A
Preparation of ——:
Herzog 279A
Riedel 283A

Hexamethylenetetramine—*continued.*
Use of —— as fuel as substitute for spirit. (P) Hänig 814A

Hexanitrodiphenyl; Sensitiveness of —— to mechanical shock as compared with that of hexanitro-compounds of similar constitution. Van Duin 395A

Hexanitrodiphenylamine; Manufacture of ——. (P) Marshall, and Du Pont de Nemours and Co. 240A
Manufacture of compressed explosive bodies from ——. (P) Von Schroetter 380A
Manufacture of explosives from trinitrotoluene and ——. (P) Von Schroetter 382A
Preparation of —— and its use as a primer for shell charges. Marshall 429A

Hexanitrotriphenyl phosphate; Manufacture of ——. (P) Imhausen und Co., and Lehmstadt 282A

Hexene-3-ol-6; Presence of —— in essential oil of freshly fermented tea leaves. Van Romburgh 527A

Hide; Biological and chemical history of ——. Relation of elastin to tanning process. Möller 36A
powder; Formaldehyde titration of —— and tanning with aldehydes. Gerngross 780A
powder; Preparation of lightly chromed —— for analysis of tanning materials. Baldracco and Camilla 460A
powder; Relation between hydrolysis and adsorption by ——. Moeller 730A, 730A

Hides; Coloration of animal —— by means of *o*-vanillin and *o*-protocatechuic aldehyde. Gerngross 497A
Degreasing —— preparatory to tanning. (P) Krouse 497A
Delliming ——. (P) Haberer und Co 460A
Determination and behaviour of free sulphuric acid in animal ——. Immerheiser 731A
Liming and dehairing ——. (P) Remer and others 308A
Liming and other tanning operations upon ——. (P) Owen 528A*
Machine for treating ——. (P) Mercier 684A*
Means for circulating liquor in liming of ——. (P) Boston and Sons, and Fairrie 758A*
Processes based on action of enzymes for bating —— and baths, mixtures, etc., for use therein. (P) Rampichini & Co. 633A
Recovery of proteins from waste liquors from treatment of —— (P) Peck, and Dorr Co. 633A
Tanning and liming of ——. (P) Dufour and Dufour 165A
Velocity of delliming of limed ——. Grasser 418A
See also Pelts *and* Skins.

High-temperature reactions; Apparatus for conducting ——. Festrup, and Techno-Chemical Laboratories, Ltd. 54A

Histamine, Colorimetric determination of —— in proteins and protein-containing matter. Hanke and Koessler 760A
and a histamine-like substance as decomposition products of albumoses. Nagayama 673A

Histidine; Determination of —— in proteins and protein-containing matter. Hanke and Koessler 760A

Histology; Use of commercial inks in plant ——. Bugnon 86A

Hog-cholera serum; Production of refined ——. (P) Reichel, and Mulford Co. 336A
virus; Artificial cultivation of ——. (P) Prescher 350A

Hokkaido. *See under* Japan.

Holland. *See* Netherlands.

o-Homophthalimide. *See* 1.3-Dihydroxyisoquinoline.

Honduras; New sugar industry in —— 341R

Honey; Antiscorbutic value of ——. Faber 700A
artificial; Manufacture of —— from crude sugar solutions (P) Meyer 669A
of bees; Detection of invertase in ——. Callias 309A
Occurrence of melizitose in ——. Hudson and Sherwood 421A

Hongkong; Dye situation in —— 311R
Glass trade of —— 44R
Peanut oil trade of —— 245R
Trade of —— in 1919 311R
Trade of —— in oils and oilseeds 311R

Hop bark; Obtaining fibres from ——. (P) Dammer 58A
-bines, Manufacture of textile fibres from ——. (P) Küchenmeister 492A
-bines; Production of fibres capable of being spun and a tannin-like material from ——. (P) Rois 13A
stems; Manufacture of basket or binding material from ——. (P) Chem. Bleicherei Jetter 102A

Hops; Analysis of bitter acids of —— and their changes during hop boiling. Lüers and Baumann 482A
Colloid-chemical studies on bitter acids of ——. Lüers and Baumann 482A

Horn-like material; Manufacture of —— from casein. (P) Weise 364A, 364A

Horse flesh in human dietary. Trowbridge 2A

Hubbard squash seed; Fatty oil of ——. Baughman and Jamieson 49A

Humic acid. Fuchs 60A
Protective action of —— in coagulation of clay. Odén 60A

Humic acids; Synthesis of —— from phenols. Piutti and Koch 57A

Humin formed by acid hydrolysis of proteins; Origin of ——. Holm and Gortner 57A

Hazards; Chemical properties of —— and their utilisation for protection of combatants against explosive gases. Siegfeld du Bellay and Rondeau 806A
Hungary; Chemical industry in —— 219R
Hutter (Matthias) Lecture. Photographic images —— visible and invisible. Renwick 156T, 196R
Hydrazine derivatives; Manufacture of ——. (P) Rosenmund 675A
Hydrazine preparations; Analysis of ——. Van den Berg .. 178A*
Hydrates; Caking of crystalline ——. Lowry and Hemmings 105T
Hydraulic ingredient; Manufacture of ——. (P) Meyer, and Chemical Foundation, Inc. 547A*
Hydrazine; Rapid determination of ——. Baillie and others 639A
Hydrazones of monosaccharides; New ——. Van der Haar 244A
Hydrides; Elements which form gaseous ——. Paneth .. 748A
Hydrobromic acid; Manufacture of —— from free bromine. (P) Consolidierte Alkaliwerke 20A
Hydrocarbon compounds; Apparatus for electrochemical treatment of liquid ——. (P) Cherry 260A
filters. (P) Hills 216A
gas; Manufacture of ——. (P) Macdonald 650A
liquids; Manufacture of —— from carbonaceous materials. (P) Rousseau 716A
liquids; Obtaining volatile —— from gases. (P) Bayer 684A
material; Extracting —— from shale and similar bituminous rocks *in situ*. (P) Day 539A
mixtures; Separation of solidified constituents, *e.g.*, paraffin, from sulphurous acid solution containing unsaturated hydrocarbons in treatment of —— with liquid sulphur dioxide. (P) Allgem. Ges. für Chem. Ind. 716A
vapours; Apparatus for electrochemical treatment of ——. (P) Cherry 716A
Hydrocarbons; Analysis of —— by aid of bacteria. Tausz and Peter 357A
Apparatus for continuous distillation and fractionation of ——. (P) Allan 813A
Apparatus for cracking ——:
(P) Wellman, and Kansas City Gasoline Co. .. 440A
(P) Yaley 221A
Apparatus for cracking and distilling ——. (P) Coast, and Process Co. 566A
Apparatus for producing gasoline and other products from ——. (P) Daugherty 742A
Apparatus for producing light ——. (P) Yunck .. 651A
Apparatus for treatment of ——. (P) Rittman .. 716A
aromatic; Determination of —— in petrol. Florentin und Vandemberghe 325A
aromatic; Determination of —— in petroleum spirit. Hess 565A
aromatic; Oxidation of ——. (P) Andrews, and Selden Co. 100A
aromatic; Rapid determination of —— in light petroleum oils. Hess 509A
aromatic; Removal of —— from mineral oils by means of trinxymethylene-sulphuric acid. Tausz 147A
aromatic; Removing —— from water or other liquids. (P) Leggett, and Ozone Co. of America 540A
Carbon-removing means in cracking ——. (P) Rittman and Dutton 221A
Chlorine oxidation of ——. Franck 395A
Continuous production of light —— from heavy hydrocarbons and waste products. (P) Zeller und Gmelin 742A
Continuous purification and neutralisation of liquid ——. (P) Heinemann and Hellmann 777A
Continuous treatment of —— with liquid sulphur dioxide. (P) Allgem. Ges. für Chem. Ind. 814A*
Conversion of ——. (P) Fleming, and Fleming Co. .. 99A
Conversion of high-boiling hydrocarbons into petroleum spirit and of unsaturated into saturated ——:
(P) Bergius, and A.-G. für Petroleum-Ind. .. 222A
(P) Bergius, and Chemical Foundation, Inc. .. 556A*
Conversion of liquid ——. (P) McComb and Patterson 396A
Cracking ——:
(P) Coast, jun., and Process Co. 652A
(P) Rittman 222A
(P) Wellman, and Kansas City Gasoline Co. .. 651A
Dehydrogenation of —— by means of palladium-black. Zelinsky and Von Putnoky 54A
Desulphurising sulphur-bearing ——. (P) Hall Motor Spirit, Ltd., and McCrea 396A
Destruction of retraction of ——. Darmois 812A
Distillation of liquid ——. (P) Pershall 510A
Distillation apparatus for cracking ——. (P) Cherry .. 716A
Extraction of —— from coal or other carbonaceous matter. (P) Mott 503A
Fractional distillation of ——. (P) Von Grosling, and Atlas Process Co. 182A
Fractionating distillation plant for coal tar ——. (P) Bennett 325A
Hydrogenation of —— in gas catalysis. Fleischer 768A
Hydrogenation of —— with unsaturated cyclic ——. [illegible] 396A
[illegible] 384A
[illegible] 384A
[illegible] 384A
Hydrocarbons, chlorinated; Manufacture of ——. (P) Chlorine Co. of America 327A
Manufacture of low-boiling —— from high-boiling hydrocarbons, tar, or the like. (P) Schwarz .. 666A
Manufacture of low-boiling —— from natural gas, or other purified gases. (P) Apparate-Verkehrs-Ges. 614A
Manufacture of lower-boiling —— from higher-boiling hydrocarbons. (P) Houlehan, and Pont de Nemours and Co. 325A, 442A
Method of making solid —— emulsifiable with water. (P) St.-Rochus Ges. 413A
and other substances; Decomposition of —— in the liquid and/or vapour phase. (P) Mann 440A
Oxidation of —— by oxygen. Kelber .. 220A, 714A
Rectification of ——. (P) De Bataafsche Petroleum-Maatschappij, and De Brey 7A, 396A
Refining liquid ——:
(P) Dunstan 290A
(P) Wellman, and Kansas City Gasoline Co. .. 440A
Solvent for extraction of liquid and solid ——. (P) Tetralin Ges. 665A
Treatment of ——:
(P) Andrews and Averill, jun. 280A
(P) Coast, jun., and Process Co. 326A
(P) Cross, and Gasoline Products Co. .. 221A
(P) Forwood and Taplay 651A
(P) Jones, and Kansas City Gasoline Co. .. 651A
(P) McOmber and Belknap 651A
(P) Rosenbaum 99
Treatment of liquid —— for the transformation thereof. (P) Cassal and others 290A
Treatment of —— for production of lighter hydrocarbons. (P) Andrews and Averill, jun. .. 396A
Treatment of —— with sulphurous acid. (P) Allgem. Ges. für Chem. Ind. 98
Hydrocelluloses; Action of alkaline earths on various kinds of ——. Schwalbe and Becker 511A
Hydrochloric acid; Apparatus for producing ——. (P) Lasher, and Kansas City Refining Co. 404A
Apparatus for producing —— from sludge acid from treatment of mineral oils. (P) Lasher, and Kansas City Refining Co. 481A
Manufacture of ——. (P) Telsler 16A
Manufacture of —— from acid sludge from refining of mineral oils (P) Lasher, and Kansas City Refining Co. 404A, 404A
Manufacture of alkali nitrates and ——. (P) Reinau .. 449A
Manufacture of —— from alkaline-earth salts. (P) Behrens 748A
Manufacture of chlorine from ——. Baumann .. 746A
Manufacture of —— from chlorine:
(P) Consolidierte Alkaliwerke 20A
Gibbs 515A
Manufacture of magnesia and ——. (P) Beck 364A
Reaction between potassium permanganate and ——. Venable and Jackson 402A
Specific heat of dilute solutions of ——. Richards and Rowe 625A
vapour; Apparatus for condensing and purifying ——. (P) Rosenthal 20A
works; Report on —— by the Alkali Inspector .. 277R
Hydrocupreines and their toxins; Surface action of ——. Traube 183A
Hydrocyanic acid; Action of —— on dextrose. Bougault and Perrier 524A, 695A
content of *Phaseolus lunatus* beans Lührig .. 277A, 352A
Detection of —— in a case of poisoning. Its post-mortem transformation with thiocyanic acid. Chelle 47A
Determination of ——. Morris 266R, 613A
Disinfection with ——. Fühner 79A
Effect of —— on plants. Wehmer 107A
Fixation of nitrogen as —— by means of an electric arc. Briner and Baertsus 105A
Generation of —— in the seed of *Schleichera trijuga*. Sen-Gupta 90T
Identification of traces of ——. Chelle 138A
Manufacture of ——:
(P) Buchanan, and American Cyanamid Co. 722A
(P) Mueller 647A
Modification of Francis-Connell method of determining ——. Menaul and Dowell 277A
produced by beans; Determination of ——. Campbell 536A
in Rangoon beans. Koenig 325A
Synthesis of —— by catalysis. Mailhe and De Godon 747A
Hydroelectric power. *See under* Power.
Hydrofluoric acid; Removal of —— from phosphoric acid. (P) Ross 231A
Hydrogen and air; "Maximum-speed mixtures" of ——. Payman 191A
and air; Radiation in explosions of ——. David .. 812A
Apparatus for indicating and recording quantities of carbon monoxide in ——. (P) Rideal and Taylor 23A
Apparatus for producing ——. (P) Zeller 238A
Apparatus for production of —— from exhaust steam. (P) Lang 6A
Behaviour of —— towards platinum. Geddes and [illegible] 186A
Catalytic influence of [illegible] and ——. [illegible] 384A

PAGE

Catalytic production of —. (P) Lang 649A
— chloride reactions; Increasing the activity of —. (P) Berlin-Anhaltische Maschinenbau A.-G. .. 722A
Compatibility of mixtures of helium and —. Sattarly and Burton 643A
Contact potentials and dielectric capacities of metals in relation to occlusion of —. Lewis 550A
cylinders; Results of cold working of steel —. Book 115A
Deoxidation of steel with —. Whiteley 691A
Desulphurising action of — on coke. Powell .. 811A
Detection of —. (P) Goold-Adams and others .. 318A
Determination of oxygen in —. (P) Badische Anilin und Soda Fabrik 86A
electrode; Simple —. Bailey 271A
electrode; Titrations with the —. Treadwell and Weiss 612A
Electrolytic cells for production of oxygen and —: (P) Benjamin 271A
(P) Miller 375A
Equilibrium between methane, carbon, and —. Coward and Wilson 94A
Formation of free — in the reversed ammonia flame. Miller 187A
Generation of — from ferrosilicon and sodium hydroxide solution. Weaver 403A
generators. (P) Griggs 23A, 518A
of high purity; Preparation and testing of —. Edwards 10A
Influence of hydrogen sulphide on occlusion of — by palladium. Maxted 782A
Interaction of chlorine and —. Chapman and Whiston 62A
ion concentration of acid solutions, *e.g.*, chrome tanning liquors; Contrasting effects of chlorides and sulphates on —. Thomas and Baldwin 423A
ion concentration; Determination of —: Bunker 249A
Pinkhof 175A
ion concentration of some standard solutions at various temperatures. Walbum 706A
Laboratory electrolytic apparatus for preparation of —. Palmer 316T
Manufacture of —: (P) Abbott, and Improved Equipment Co. .. 597A
(P) Badische Anilin und Soda Fabrik .. 64A
(P) Bosch and others 267A*
(P) British Oxygen Co., and others 571A

Hydrogenation—continued.
of unsaturated glycerides; Function of catalyst in ——. Thomas .. 12T
of unsaturated glycerides in presence of finely-divided nickel; Mechanism of ——. Thomas .. 10T, 70R
Hydronaphthalenes; Manufacture of ——. (P) Tetralin Ges. 743A
Hydroquinine; Surface action of homologues of —— and of their toxins. Traube .. 133A
Hydroquinone. *See* Quinol.
Hydroretenes. Virtanen .. 792A
Hydrosols; Catalytic hydrogenation by protected ——. Bidal .. 466A
Hydrosulphides; Volumetric determination of —— in presence of sulphides, thiosulphates, and sulphites. Wöber .. 625A
Hydrosulphite liquors; Preserving —— from decomposition. (P) MacIntyre .. 334A
Hydrosulphites; Evaluation of ——. Bruhns .. 402A
Hydroxides; Behaviour of concentrated solutions of alkali chlorides during evaporation in presence of alkali ——. Chorower .. 687A
Manufacture of alkali ——: (P) Charlton, and American Potash Corp .. 597A (P) Sadtler .. 689A
Manufacture of non-colloidal metallic ——. (P) Buchner, and Chemical Foundation, Inc. 488A, 488A
Hydroxyaldehydes and their ethers, Manufacture of ——. (P) Weiss .. 527A
Hydroxyanthraquinone derivatives, Determination of —— in the *Polygonaceæ*. Steenhauer .. 172A
Hydroxyanthraquinones; Acetylation of ——. Dimroth and others .. 390A
Metallic derivatives of —— Crossley .. 152A
Oxidative formation of hydroxydianthraquinonyls from ——. Scholl and others .. 152A
Hydroxyazo dyestuffs. *See under* Azo dyestuffs.
Hydroxybenzenesulphocarboxylic acids and their homologues; Preparation of mercury compounds of ——. (P) Saccharinfabr A.-G. Fahlberg, List und Co. .. 675A
1-Hydroxy-4-chloroanthraquinone. Ullmann and Conzetti 480A
Hydroxydianthraquinonyls, Oxidative formation of —— from erythrohydroxyanthraquinone and quinizarin Scholl and others .. 152A
4-Hydroxy-3,5-dimethoxyphthalic acid, Synthesis of ——. Alimchandani and Mekhrum 703A
β-Hydroxyethylaminobenzoic esters, Manufacture of mono- and di- ——. (P) Soc Chim Usines du Rhône .. 280A
Hydroxyl ions; Determining concentration of —— in concentrated solutions of alkali hydroxides Fricke 363A
p-Hydroxyphenylurea; Sweetening power of derivatives of ——. Boedecker and Rosenbusch .. 557A
Hydroxysulphonic acids; Manufacture of tanning substances from β- and α-arylsulpho derivatives of aromatic ——. (P) Ges. f. Chem Ind. in Basel .. 666A
Hydroxytrimethylenediglycine; Manufacture of ——. (P) Krause .. 174A
Hymenula globosa; Constituents of ——. Henry 414R
Hygrometers actuated by animal or vegetable fibre. (P) Halliwell .. 643A*
Hygroscopic materials; Drying, conditioning, and regulating the moisture content of ——. (P) Carrier, and Buffalo Forge Co. .. 217A*
substances; Apparatus for determining melting point of ——. Becker .. 137A
Hyoscyamine; Isolation of ——. (P) Chem Fabr. vorm Sandoz .. 426A
Hypnotics; Dialkylhomophthalimides, a new class of ——. Lamiga and Perrin .. 763A
Hypochlorite cell; Electrolytic ——. (P) Gerstle, and Electro-Chemical Co. .. 517A
preparations for wound treatment; Manufacture of stable solid ——. (P) Bayer und Co. .. 40A
Hypochlorites; Electrolytic apparatus for direct production of ——. (P) Pestalozza .. 597A, 689A
Hypochlorous acid; Strength of —— in solution, with particular reference to eusol McCrae .. 347A
Hypoiodous acid; Determination and kinetics of —— in acid solution. Cofman .. 363A

Sundberg and Lundborg 604
value of fats and oils; Determination of —— by Winkler's bromate method. Lakhani and Sudborough 341A
Iodine compounds, Extraction of —— from marine algæ. (P) Darrasse Frères, and Dupont 469A
Iodoform reaction for detecting alcohol; Modification of ——. Kunz 764A
Ions in ultra-filtrates and other protein-free solutions; Determination of concentration of ——. Brinkman and Van Dam 614A
Ipecacuanha alkaloids; Enteric preparation of ——. (P) Lilly and Lilly and Co 765A
preparations, Determination of ipecacuanhic acid in ——. Huerre 500A
Ipecacuanhic acid; Determination of —— in ipecacuanha preparations. Huerre 500A
Ireland, Peat resources of ——. Purcell 213R
Iron; Action of concentrated sulphuric acid on ——. Fawsitt 147R
alloy lining for furnaces. (P) Copland, and Elyria Iron and Steel Co. 507A
or its alloys; Casting ——. (P) Falvet 96A
alloys containing nickel and chromium. (P) Soc. Anon. de Commentry, Fourchambault et Decazeville 412A, 412A
alloys containing nickel, chromium, and tungsten (or molybdenum). (P) Soc. Anon. de Commentry, Fourchambault, et Decazeville 412A
alloys; Corrosion-resisting —— (P) McClure .. 526A
alloys for firearms; Manufacture of ——. (P) Fahrenwald 807A
alloys; Manufacture of chromium-containing ——. (P) Fahrenwald 807A
and its alloys; Manufacture of pure —— in powder form. (P) Allgem. Elektrizitäts-Ges. 348A
alloys not brittle at low temperatures. (P) Soc. Anon. de Commentry, Fourchambault, et Decazeville 412A
Alloys suitable for protective coatings for ——. (P) A.-G. der Dillinger Hüttenwerke 272A
-aluminium bronze as acid-resisting alloy. Knowlton 138A
Application of rotating "reductors" in determination of —— Scott 138A
articles; Coloured ——. (P) Jernegin, and Wisconsin Rapid Ink Artist Co. 272A

articles; Preparation of —— for coating by the metal spraying process. (P) Frankenfeld, A.-G., f. Metallisierungsmaschinen vorm. Metallkanone Ges. .. 631A
beams; Use of —— in analysis. Davis 594A
Behaviour of —— in contact with sulphuric acid. Fawsitt and Pain 193A
Bessemerising ——. (P) McCaffery 455A
Blue-brittleness and ageing of ——. Feitweis 410A
Carburising ——. (P) De Bats, and New Process Metals Corp. 413A
cast-; Crystalline nature of graphite and temper carbon obtained from ——. Iokibe 785A
cast-; Desulphurising ——. (P) Ellis, and Ellis-Foster Co. 413A
cast-; Influence of nickel and cobalt on physical and chemical properties of ——. Bauer and Piwowarsky 723A
cast-; Manufacture of fine-grained soft ——. (P) Marz 822A
cast-; Manufacture of refined —— from pig iron. (P) Verein. Hüttenwerke Burbach-Eich-Dudelingen 28A
cast-; Refining ——. (P) Barnes and Genter .. 117A
castings; Annealing malleable ——. (P) Howgate .. 416A*
Cementation of ——. (P) Luttenschlager 520A
-chromium alloys; Manufacture of ——. (P) Ballantine 787A
-chromium-titanium alloys; Manufacture of ——. (P) Sicard, and U.S. Ferro-Alloys Corp. 724A
Cleaning sheet —— for enamelling. Danielson .. 111A
Coating sheet —— with metals. (P) Lippmann .. 371A
Coating —— with white metal:
(P) Haas 493A
(P) Riley 416A*
-cobalt alloys; Change of length by magnetisation in ——. Honda and Kido 629A
copper-coated; Separating copper from ——. (P) Hirsch Kupfer- und Messingwerke A.-G., and Von Grotthus 631A
Corrosion of ——:
Kettwinkel 547A
Richardson 600A
Crystallography of α- and β- ——. Giolitti 410A
Deoxidation of —— by means of calcium carbide. (P) Röchlingsche Eisen- und Stahlwerke, and Rodenhauser 195A
Determination of carbon in ——. Yensen 367A
Determination of content of non-ferrous constituents, especially carbon, in ——. (P) Enlund 456A
Determination of —— by cuprferron. Archibald and Fulton 585A
Determination of —— in iron ores by permanganate: Brandt 268A
Schwarz 409A
Determination of minute quantities of —— in grape must etc. Mathieu 431A
Determination of oxygen in ——. Oberhoffer and Von Keil 574A
Determination of phosphorus in ——. Kinder .. 410A
Determination of phosphorus in hæmatite —— and its commercial importance. Ridsdale. 409A
Determination of small quantities of —— as thiocyanate. Willstätter 585A
Determination of titanium and —— in rocks. Ferrari 837A
Direct production of refined —— from titaniferous ores. (P) Lake and Lake 196A*
Effect of chromium compounds on corrosion of —— in sulphuric acid. Heise and Clemente 822A
Effect of various elements on the electrical resistivity of ——. Norbury 452A
Electro-deposited —— 399R
electro-deposited; Defects in ——. Hughes 451A
Electro-deposited; Structure of ——. Hughes .. 434R
electrolytic; Annealing of ——. Cournot 599A
Electrolytic deposition of ——. Macfadyen 113A
Electrolytic extraction of —— directly from its ores. (P) Pig 413A
electrolytic; Manufacture of soft ——. (P) Schlötter 724A
Electrolytic method of cleaning ——. (P) Marino .. 70A*
Extraction of —— from ore, and formation of alloys thereof. (P) Rouse 787A
Extraction of —— from ores. (P) Jones 661A
Filings for pharmaceutical use; Analysis of ——. Kinsley 247A
Forged; Solidifying conglomerates of ——. (P) Tschirch 302A
Formation of Lorraine; Fate of —— 58R
Furnace for manufacture of ——. (P) Cornalli .. 29A
Furnace for heat treatment of ——. (P) August .. 783A
Galvanised ——. *See under* Galvanised.
Grain size; Growth of ——. Okochi and Sato .. 547A
Grain size; Strains in different grades of ——. Bauer 451A
Grate; Manufacture of ——. (P) Stock 579A
Hardening as film treatment of ——. (P) Jones .. 66A
Hardening —— by means of a mixture containing titanium. (P) Bekker 575A
Hardening the carbonitrides of —— during heat treatment. (P) Wild and Bardell 31A*
Hardness in Austenite 394R
Hardness in Ferrite 394R
Hardness in Pearlite 394R
Hardness of Pearlite —— in Tungsten Metal 127R
Hardness of Pearlite —— in Tungsten Steel 127R
Hardness; Relation between Brinell and Monotron 577A
Hardness; Transformation of Austenite, Martensite and Troostite in relation to ——. Bain and Davenport 511A
Heating; Influence of —— on the electrical resistivity of ——. Norbury 452A
Heating; Influence of —— on the magnetic properties of ——. Norbury 452A
Heating; Influence of —— on the mechanical properties of ——. Norbury 452A
Heating; Influence of —— on the thermal conductivity of ——. Norbury 452A
Heating; Influence of —— on the thermal expansion of ——. Norbury 452A
Heating; Influence of —— on the thermo-electric power of ——. Norbury 452A
Heating; Influence of —— on the volume

separator for treating ferrous ores. (P) Quinofiero .. 788A
separators. (P) Uhlig 520A*
susceptibility; Variation of —— during allotropic transformations and melting of some substances. Ishiwara 629A

Magnetisable cores; Manufacture of ——. (P) Huth and Loewe 162A

Maize; Comparative nutritive value of white and yellow ——. Steenbock and Boutwell 245A
Effect of mould on the oil in ——. Babak 163A
gluten meal; Nutritive value of commercial —— Johns and others 381A
and maize meal; Cause of deterioration and spoiling of ——. McHargue 381A
oil. *See under* Oils, Fatty.
silage; Rôle of pentose-fermenting bacteria in production of ——. Peterson and Fred 277A
steeping; Recovering protein and phosphates of calcium and magnesium from acid waste waters from —— (P) Giesecke 671A, 798A

Maleic acid; Formation of —— by catalytic oxidation of benzene. Weiss and Downs 307A
Manufacture of ——. (P) Weiss and others .. 44A
Synthesis of —— Weiss and Downs 57R

Malt analysis; Application of formol titration to —— Langkammerer and Leberle 202A
Determination of moisture in —— Ward .. 127A
extracts; Determination of diastatic power of —— Rosenblum 311T
Grinding ——. (P) Schott 790A
Influence of temperature, concentration, duration of mash, and slackness of malt on starch products of extract of —— O'Sullivan 9R, 22T
Mashing experiments with a defectively modified —— Lüers and Schneider 830A
used for saccharification of amylaceous materials, Reducing amount of —— (P) Deutschland .. 760A

Maltase solutions from yeast Willstätter and others .. 760A

Malting and brewing. Petit 345A
Changes produced in starch and nitrogenous substances during ——. Tombeur 461A
grain; Steeping and —— (P) Rummel .. 524A
process. (P) De Fazi and Peroni 499A

Maltose; Preparation of —— from starch Falch .. 732A
syrup 436R

Malts; Analyses of barleys and of the —— made from them. Ling 128A

Malva crispa; Manufacture of textile fibres from —— (P) Hammer 360A

Manchester Steam Users' Association memorandum for 1918–1919. Stromeyer 97R

Manchuria; Magnesite and talc deposits in —— .. 143R

Manganates; Manufacture of alkali —— (P) McCormack, and Research Laboratory of Chicago 448A
(P) Vanderkleed, and Hercules Powder Co .. 448A

Manganese; Alloys of —— with bismuth, with zinc, and with silver Siebe 27A
and its alloys; Manufacture of —— in the electric furnace. (P) Lenlor 118A*
carbon alloys; Equilibrium diagram of —— Kido .. 786A
Detection of —— by means of diphenyl derivatives Feigl 706A
Detection of zinc and —— in presence of phosphates and oxalates Schmidt 530A
Determination of —— in biological material, and data on manganese content of human blood and tissues Reimann and Minot 612A
Different methods of estimating —— and their use in examination of plant ashes and similar products Wester 469A
industry of Georgia 115R
Influence of —— on corrosion of iron and steel Richardson and Richardson 752A
Mechanical properties and resistance to corrosion of rolled light alloys of aluminium, magnesium, and ——. Merica and others 454A
nickel steel, Improving non magnetic —— (P) Thenbert 302A
ore in India 99R
ore in Society Islands 321R
ore; Supplies of —— 294R
ores; Treating oxide —— (P) Clevenger and others 661A
ores; Treatment of —— (P) Van Arsdale and Maier 631A
Sensitive reaction for —— Hermans 283A
Separation of chromium and —— Herschkowitsch 502A
Separation of —— from iron by cupferron Archibald and Phelps 585A
steel; Manufacture of ——. (P) American Manganese Steel Co. 314A*
steel; Method of recovering ——. (P) American Manganese Steel Co. 30A*
steel shots; Manufacture of ——. (P) Hadfield .. 549A*
in U.S.A. in 1917 .. .. 148R
in U.S.A. in 1918 .. .. 288A
Use of phenylphthalein and diphenylamine in persulphate method for determination of ——. Wester 612A
Volumetric estimation of ——. Nicolardot and others 951A

Manganese compounds; Absorbent power of soils with respect to ——. Nottin 553A
compounds; Acid soils and toxicity of ——. Funchess 200A
compounds; Action of —— on plant growth. Pfeiffer and others 606A

Manganese dioxide depolarising masses; Regenerating exhausted —— from electric cells. (P) Klopstech 272A
Manufacture of ——:
(P) Chapman, and National Carbon Co. .. 544A
(P) Westling 109A
Manufacture of conducting hydrated black ——. (P) Ellis and others 267A
Manufacture of electrodes composed of lead peroxide or/and ——. (P) Bardt 824A
ore; Uses of ——. 17R
Purification of ——. (P) Gravely, and Winchester Repeating Arms Co. 68A

Manganese oxide depolarising agent; Electrolytic manufacture of higher ——. (P) Ellis, and National Carbon Co. 71A
oxide; Purification of —— for use in electric batteries. (P) Ruhoff, and French Battery and Carbon Co. 550A
oxides; Manufacture of —— (P) Lovelace 689A
salts; Reaction for —— Denigès 596A
sulphate peroxide, Preparation of —— and oxidation of toluene by it Nakao 625A

Manganiferous ores in U.S.A. in 1917 .. .. .. 148R
ores in U.S.A. in 1918 .. .. 288R
silicate slag; Reduction of ——. Kern 370A
slags and ores; Working up —— by wet chlorination (P) Bayer und Co 373A

Mangrove tannin; Detection of —— in mixed tanning extracts Schell 490A

Mannitol; Enzymes of *B. coli communis* which are concerned in decomposition of —— Grey 680A
Oxidation of —— by nitrous fumes Votocek and Krana 76A
Physical properties of —— and of its aqueous solutions. Braham 37A

Mannose; Fermentation of —— by *Lactobacillus pentoaceticus*, n. sp Peterson and others 607A
m-Tolylhydrazone of ——. Van der Haar 244A

Mantles, Incandescence —— *See under* Incandescence

Manure, farmyard, Influence of lime on nitrification of nitrogen of —— in arable soil Barthel and Bengtsson 243A
works, Report on chemical —— by the Alkali Inspector 276R

Manures, green, Reaction of the soil as influenced by the decomposition of —— Howard 419A
Investigation of action of —— Lemmermann .. 667A

and air; Propagation of flame in mixtures of ——. Vertical propagation and propagation in currents of the mixtures. Mason and Wheeler 775A
Behaviour of —— at high temperatures alone and in contact with other constituents in firedamp explosions. Winter 740A
Equilibrium between carbon, hydrogen, and ——. Coward and Wilson 94A
Interaction of chlorine and —— under the influence of light. Whiston 384A
Latent heat of vaporisation of ——. Satterly and Patterson 539A
and nitrogen; Composition of the vapour and liquid phases of mixtures of ——. McTaggart and Edwards 539A
Oxidation of —— to formaldehyde. (P) Bailey .. 426A
Uniform movement of flame in mixtures of air with mixtures of hydrogen, carbon monoxide, and ——. Payman 95A
Uniform movement of flame in mixtures of nitrogen, oxygen, and ——. Payman 181A
Methyl acetate; Conversion of methyl chloride into ——. Whiston 384A
Methylal; Interaction of —— with unsaturated cyclic hydrocarbons Radcliffe 259A
Methyl alcohol, Conversion of methyl chloride into ——. Whiston 384A
Critical study of methods for detection of ——. Gettler 613A
Dangers of consumption of ——. Hunt 38R
Detection of —— by formation of methyl *p*-bromobenzoate. Autenrieth 585A
Detection of —— in spirits. Hasse 345A
Determination of ——:
Heiduschka and Wolf 558A
Schryver and Wood 73R, 466A
Differentiation of ethyl alcohol and ——:
Pannwitz 38A
Sabalitschka 245A
fermentation; So-called ——. Von Lippmann .. 732A
Manufacture of ——. (P) Christiansen 350A*
Manufacture of formaldehyde, methyl formate, acetone, and —— by dry distillation of formates (P) Hofmann 313A
Poisoning by —— 131R
Research in connexion with synthesis of —— .. 379R
Methylamine; Preparation of —— from ammonium methyl sulphate. Denham and Knapp 384A
Methylated spirit. *See under* Spirit.
Methyl bromide; Preparation of —— from dimethyl sulphate. Boulin and Simon 312A
Methyl carbonates; Chlorinated —— Kling and others .. 206A
Methyl chloride; Antiseptic action of —— Salkowski .. 702A
Conversion of —— into methyl alcohol and methyl acetate. Whiston 384A
Manufacture of mixtures of ethyl chloride and —— for use as solvents for extraction purposes. (P) Henning 833A
Preparation of —— from dimethyl sulphate. Boulin and Simon 312A
Methyl chlorosulphonate; Action of water on —— Guyot and Simon 466A
Methyl derivatives of arylamino compounds; Manufacture of ——. (P) Mailhe 511A
Methylene chloride; Antiseptic action of —— Salkowski 702A
Methyl ethyl ketone; Production of —— from *n*-butyl alcohol. King 134A
Methyl formate; Manufacture of formaldehyde, methyl alcohol, acetone, and —— by dry distillation of formates. (P) Hofmann 313A
Methyl formates; Industrial chlorinated —— and their analysis. Delépine 205A
N-Methylhexamethylenetetramine, Manufacture of salts of ——. (P) Tschunke, and Chemical Foundation, Inc. 802A*
Methyl orange; Effect of change in temperature on colour changes of —— and on accuracy of titrations. Tizard and Whiston 316A
as indicator. Macri 611A
Methylpelletierine. Tanret 638A
Methyl red; Preparation of ——. Desvergnes 611A
Methyl *β*-tetra-acetylglucosidoanthranilate; Synthesis of ——. Karrer and Weidmann 348A
***β*-Methylumbelliferone**; Formation of —— as a reaction of acetoacetic acid and its esters. Arreguine and Garcia 279A
Metric system; Report on compulsory adoption of —— in United Kingdom 385R

Micro-fungus; Growths of —— on rubber. Scott 633A
Micro-organisms; Toxicity to —— and chemical potential. Miller 799A
Microscopes and accessories; Exhibition of —— 34R
Microscopy; Discussion on —— 34R
Mildew; Non-toxicity of copper compounds for ——. Villedieu and Villedieu 799A
Testing resistance of textiles to ——. Levine and Veitch 292A
Milk; Acidity of "ropy" ——. Freear and Venn 608A
Action of colloids in reductase test for ——. Eichwald 346A
Alkali-forming bacteria in ——. Ayers and others .. 39A
analysis. Ambühl and Weiss 464A
analysis, Application of Ackerman's refraction method to —— Langkammerer 39A
Apparatus for atomising and drying ——. (P) Chem. Verwertungsges. 581A
Apparatus for granulating or finely dividing ——. (P) MacLachlan 39A
artificial, Manufacture of ——. (P) Erslev 382A*
Carbon dioxide content of —— as a basis for distinguishing heated from unheated milk. Van Slyke and Keeler 499A
Carbonic acid and carbonates in cow's ——. Van Slyke and Baker 130A
Composition of sediment obtained in Gerber's butyrometer in determination of fat in ——. Reiss and Diesselhorst 39A
Conditions causing variation in reaction of freshly drawn ——. Van Slyke and Baker 130A
containers 131R
Decomposition of hydrogen peroxide by micro-organisms extracted from pasteurised ——. Fouassier .. 204A
Dehydration of ——. Wright 128R
Desiccating ——. (P) Stutzke, and Buhl Co. 702A
Destruction of bacteria in —— by electricity. Beattie and Lewis 292R
Detection of abnormal —— based on hydrogen ion concentration. Baker and Van Slyke 130A
Detection of added water in —— by means of the refractometer. Utz 608A
Detection of hydrogen peroxide in pasteurised —— by means of guaiacum tincture. Fouassier 204A
Determination of added water in ——. Goldan, jun. 39A
Determination of fat in ——. (P) Höyberg .. 277A, 831A*
Determination of keeping quality of ——. Baker and Van Slyke 130A
Determination of lactose in altered ——. Hildt .. 169A
Differentiation between poor and adulterated ——. Hodgson 310A
dried; Freightage charges on —— 223R
Drying and thickening —— by means of compressed air and heated air or gases. (P) Galland 277A
Evaporator and pasteuriser for ——. (P) Buff 733A
fat, Manufacture of ——. (P) Phelps and others .. 798A
Heat coagulation of ——. Sommer and Hart 130A
Improvement and treatment of ——. Rasch 608A
Influence of acidity of —— on velocity of inactivation of the peroxydase by heat. Bouma and Van Dam 169A
Influence of formaldehyde on analysis of ——. Porcher 346A
Influence of various carbohydrates on curdling of ——. Aschenheim and Stern 556A
Limitations of reductase test for determining quality of ——. Rahn 796A
Manufacture of condensed and evaporated —— in New Zealand 111R
Manufacture of humanised ——. (P) Timpe 525A
Manufacture of reconstructed ——. (P) Bosworth, and Boston Floating Hospital 525A
Micro-organisms persisting in —— after pasteurisation: their rôle in decomposition of hydrogen peroxide. Fouassier 637A
Pasteurisation of ——. Orla-Jensen 555A
powder; Manufacture of —— in New Zealand .. 111R
Preventing the souring of ——. (P) Marcus 423A
Process for removing cream from ——. (P) Clavel 404A, 784A*
product; Condensed —— (P) Dick 465A*
products; Manufacture of artificial ——. (P) N. V. Jurgens' Vereen Fabr. 671A
records; Interpretation of ——. Monier-Williams .. 145R
serum obtained by spontaneous curdling Grossfeld .. 556A
serum, Preparation of —— for refractometric measurements. Ambühl and Weiss 464A
sour, Gerber's method of determining fat applied to ——. Day 830A
Sterilising and preserving ——. (P) Moscrop.. .. 40A
substitute; Manufacture of —— (P) Moses 282A
sugar. *See* Lactose.
Sulphuric acid unsuitable for use in determination of fat in —— in Gerber's butyrometer. Reiss .. 637A
Treatment of ——. (P) Buel 246A
Water-soluble vitamine in ——. Osborne and Mendel 432A

Niobium-steel; Manufacture of ——. (P) General Electric Co. 787A

Nitrate. *See* Sodium nitrate.

Nitrates: Colorimetric determination of —— in water. Kolthoff 761A
Colour changes of the diphenylamine reaction for ——. Harvey 530A
Colour tests for ——. Escalch 642A
Competition for Swedish market for —— 59B
Deliquescence and drying of ammonium and alkali ——. Prideaux 182A
Detection of —— in milk. Ambühl and Weiss 464A
Determination of —— in fertilisers. Moore 579A
Determination of nitrogen in —— with the nitrometer. Beckett 386A
Determination of —— in soils. Whiting and others .. 793A
Effect of chlorides on nitrometer determination of ——. Sanders 332A
Electrolytic potential of the formation of nitric oxide and —— from nitrites. Pick 446A
Manufacture of alkali —— (P) Reinau 449A
Manufacture of hydrochloric acid and alkali ——. (P) Reinau 449A
Nitrosoindole test for detection of ——. Groenewege .. 503A
Non-reduction of —— by seedlings. Davidson 167A
Preparation of diphenylamine-sulphuric acid reagent for ——. Haun 612A
Production of ——, 1913–1919 .. .. 417B
Relative availability of organic nitrogen and nitrogen of ——. Blair 379A
Short commercial analytical methods for determining purity of ——. Faber and Stoddard 528A
in South Africa 94B

Nitrating apparatus. (P) Wülfing, Dahl, und Co. 766A
aromatic substances; Apparatus applicable for ——. (P) Morris and Co., and Morris 291A
webs of cellulose. (P) Niederländer 835A

Nitre-cake; Obtaining a liquid of high acidity from ——. (P) Holmes, and Du Pont de Nemours and Co. .. 749A
Production and utilisation of ——, 1915–1919 .. .. 407B
See also Sodium bisulphate.

Nitric acid; Absorption of nitrogen oxides by dilute ——. Rideal 514A
Apparatus for recovery of sulphuric acid and —— from waste acids. (P) Beer 748A
Centrifugal pumps for ——. Tungay 149T
Concentration of ——:
(P) Bayer und Co. 404A
(P) Du Pont de Nemours and Co. 64A*
(P) Pauling 294A
Concentration of sulphuric acid and ——. (P) Bohrs .. 447A

Nitric acid—*continued.*
Continuous concentration of dilute ——. (P) Bayer und Co. 62A
Distillation of a mixture of water, sulphuric acid, and ——. Pascal 780A
Distillation of mixtures of sulphuric acid and ——. Baumann 779A
Formation of ——, from nitric oxide. Sanfourche .. 154A
Fractionation of ——. Baumann 746A
Freezing points of mixtures of sulphuric acid and ——. Holmes 625A
Manufacture of ——:
(P) Banigan, and Hercules Powder Co. .. 333A
(P) General Electric Co. 721A
(P) Henwood 819A*
(P) Thomson, and General Electric Co. .. 404A
Manufacture of —— from ammonia. (P) General Chemical Co., and De Jahn 748A
Manufacture of —— from atmospheric air. (P) Sanders and others 656A
Manufacture of —— by catalytic oxidation. (P) Maschke 447A
Manufacture of concentrated ——:
(P) Bergve and others 450A*
(P) Guye, and Gros et Bouchardy 627A*
Manufacture of concentrated —— from dilute nitric acid. (P) Reinau 487A
Manufacture of concentrated —— from nitrous gases:
Foerster and others 484A
Kaltenbach 655A
Manufacture of high-grade ——. (P) Wülfing, Dahl, und Co. 190A
Manufacture of highly concentrated ——:
(P) Bayer und Co. 20A
(P) Clemm 294A
(P) Deutsche Gasglühlicht-A.-G. 62A
Manufacture of —— from hot nitrous gases. (P) Chem. Fabr Griesheim-Elektron 364A
Manufacture of nitrogen tetroxide and pure concentrated —— from nitric acid containing oxides of nitrogen (P) Jensen, and Norsk Hydro-Elektrisk Kvaelstofaktieselskab 108A, 450A*
manufacture by Schönherr's arc process. Kodera and others 817A
and its mixtures with sulphuric acid; Specific heat of ——. Pascal and Garnier 187A
Oxidation of ammonia to ——. (P) Henwood 596A
vapour, Apparatus for condensing and purifying ——. (P) Rosenthal 20A
vapours; Condenser for ——. (P) Hough 190A
War experiences in manufacture of ——. Walker .. 445A
works; Report on —— by the Alkali Inspector .. 277B
Nitric anhydride; Manufacture of ——. (P) Guye, and Gros et Bouchardy 627A*
Nitric esters; Decomposition of ——. Farmer 639A
esters, Decomposition of —— by lime. Lowry and others 558A
nitrogen. *See under* Nitrogen.
Nitric oxide; Electrolytic potential of the formation of nitrates and —— from nitrites. Pick 446A
Formation of nitric acid from ——. Sanfourche .. 154A
Furnaces for production of ——. (P) Elektrochem. Werke Ges. 688A
Increasing the yield of —— from four-cycle gas-engines. (P) Nöh 404A
Manufacture of —— from ammonia and air. (P) Bayer und Co. 64A
Manufacture of —— in gas engines. (P) Gerhardt .. 668A
Method of working gas engines for production of ——. (P) Göllinger 647A
Production of —— in two-cycle gas engines. (P) Woll 404A
Transforming kinetic energy of gases into electrical energy and utilising latter for production of ——. (P) Petersen 696A
Velocity of oxidation of ——. Wourtzel 187A
Nitrides of the alkalis and alkaline earths, Decomposition of ——. (P) Chem. Fabr Kalk Ges. 488A
Manufacture of solid refractory bodies from ——. (P) Podszus, and Chemical Foundation, Inc. .. 450A*
Synthetic production of ——. (P) Lindblad .. 192A*
Nitrification of farmyard manure nitrogen in arable soil; Influence of lime on ——. Barthel and Bengtsson 248A
Nitrifiers; Products serving as ——. (P) Truffaut .. 684A*
Nitrifying bacteria. *See under* Bacteria.
Nitrites; Catalytic hydration of ——. Malihe 610A
Direct conversion of nitrous esters and nitro compounds into —— by catalysis. Malihe and Belegarde 172A
New method of formation of —— by catalysis. Malihe 349A
Preparation of unsaturated —— by catalysis. Malihe 384A
Nitrites: Colorimetric determination of —— in water. Kolthoff 761A
Colour tests for ——. Escalch 642A
Detection of —— in water. Thévenon 881A
Electrolytic potential of the formation of nitrates and nitric oxide from ——. Pick 446A
Manufacture of aliphatic ——. (P) De Wilde .. 247A
Sensitive reaction for ——. Hermans 488A
Nitrocotyledilukoge. Odde 12A
Nitrobenzene. Action of aluminium chloride on a mixture of toluene and ——. Kliegl and Huber 777A
Determination of course of catalytic reduction of ——. Nord 84A

PAGE

Nitrobenzene—*continued.*
-water interface; Emulsification by adsorption at a ——. Sheppard 100A
Nitrobenzoic acids; Oxidation of nitrotoluenes to ——. Bigelow 6A
Nitrocarbohydrates; Manufacture of ——. (P) Anchors .. 249A
Nitrocellulose; Absorbent power for gases, and constitution of ——. Oddo 12A
as aeroplane dope 201R
Apparatus for mixing —— with fluids. (P) Bloomis, and Arlington Co. 136A
compositions; Manufacture of ——. (P) Carroll, and Eastman Kodak Co. .. 745A
(P) Seel, and Eastman Kodak Co. 541A
compositions; Plastic ——. (P) Dow, and Dow Chemical Co. 483A
Detection of ligneous impurities in cotton and cotton waste for manufacture of ——. Barrett 81T
Displacement of liquid in —— by other liquids by aid of electro-osmosis. (P) Elektro-Osmose A.-G. 374A
Displacing water from —— by means of alcohol. (P) Elektro-Osmose A.-G. 208A
Estimation of nitrogen in —— with the nitrometer. Reckett 386A
Examination of ——. Schrimpff 314A, 429A
film of low inflammability. (P) Jarvis 719A
Gelatinising ——. (P) Elektro-Osmose A.-G. .. 430A
Gelatinising liquids containing —— (P) Crane, and Arlington Co 249A
Gelatinising —— in manufacture of explosives. (P) Rintoul and others 641A*
German stability tests for —— and a new heat storage test. Lenze and Pleus 281A, 468A
Influence of nitroglycerin on viscosity of solutions of —— in ether-alcohol. Gibson and McCall 175T
Manufacture of ——:
(P) Claessen 469A
(P) Deutsche Gasglühlicht A.-G. 803A
(P) Vajdafy 429A
(P) Verein Köln-Rottweiler Pulverfabr. .. 282A
powder in the form of cords or threads; Increasing the density or diminishing the porosity of ——. (P) Voith 207A
powder; Preparation of cotton cellulose for manufacture of —— Punter 343T
powders, Manufacture of ——. (P) Chem Fabr. von Heyden A.-G 430A
Precipitation of —— from organic solvents. (P) Vereinigte Cöln-Rottweiler Pulverfabriken 122A
Process for safely drying —— before gelatinisation. (P) Claessen 676A
pulp; Continuous washing and dehydration of ——. (P) Müller 400A
Purification of ——:
(P) Duclaux 469A*
(P) Elektro-Osmose A.-G 60A
Solubility of —— in methyl alcohol. Luff 34R
Stabilising —— (P) Van der Laan 641A
Viscosity of solutions of —— in ether-alcohol. Gibson and McCall 172T
Viscosity of solutions of —— in mixtures of acetone and water Masson and McCall 641A
from wood-pulp Woodbridge, jun. 386A
Nitrocelluloses, Fractional precipitation of ——. Duclaux and Wollman 528A
Nitro-compounds; Analysis of aromatic —— by means of titanium trichloride Inglish 777A
-compounds; Direct conversion of —— into nitrites by catalysis Malihe and Bellegarde 172A
-compounds; Examination of —— by means of titanium chloride and sulphate Van Duin 586A
-compounds; Influence of position of substituents on the behaviour of aromatic —— in the Kjeldahl estimation of nitrogen Margosches and Vogel .. 82A
-compounds; Manufacture of —— (P) Perruche .. 57A*
-compounds; Preparation of aromatic —— from retene and its derivatives (P) Arnot 291A
-compounds, Purification of aromatic ——. (P) Sprengstoff A.-G Carbonit 676A
-compounds; Reduction of aromatic ——. (P) Tcherniac and Davies 704A
-compounds; Reduction of aromatic —— by means of platinum and hydrogen Cusmano 328A
-compounds; Reduction of aromatic —— by stannous chloride and by titanous chloride, and their volumetric estimation Florentin and Vandenberghe .. 224A
-compounds; Titration and partial reduction of —— with titanous chloride. Van Duin 139A
Nitrocotids; Calculations involved in preparation of acid mixtures used in manufacture of ——. Young .. 315T
2-Nitro-4-cyanobenzaldehyde. Reich and Lens 224A
Nitro-derivatives of diphenylamine. Van Duin and Van Leeuwen 151A
-derivatives of naphthalene and anthraquinone. Dhar 685A
-derivatives of tetrahydronaphthalene and its homologues; Manufacture of —— (P) Tetralin Ges. 174A
Nitroform; Determination of —— by potassium permanganate. McKie 557A
Nitrogen; Boric acid modification of Kjeldahl method for determination of —— in crops and soils. Scales and Harrison 461A
Catalytic production of ——. (P) Lang 449A

PAGE

Nitrogen—*continued.*
Combustion of ——. (P) Gewerkschaft des Steinkohlenbergwerks "Lothringen," and Kelting .. 783A
content of plants; Relation between calcium and —— and function of calcium. Parker and Trueg .. 699A
Detection of —— in organic compounds by Castellana's reaction. Fileringa 660A
Determination of —— in celluloid and explosives with the nitrometer. Nicolardot and Vourloud .. 174A
Determination of —— in coal, coke, and tar. Parker 507A
Determination of —— in nitrocellulose and nitrates with the nitrometer Beckett 386A
Determination of rate of solution of atmospheric —— by water. Adeney and Becker 211A
Determination of —— in sodium nitrate by the modified Devarda method Butt 446A
Electric furnace for oxidation of ——. (P) Elektrochem. Werke Ges 375A
Electrical fixation of atmospheric ——. (P) Bloom 782A
Electrical separation of —— from neon and mercury vapour. (P) Skaupy 620A
fixation; Apparatus for ——. (P) Nitrogen Products Co. 690A*
Fixation of atmospheric ——:
(P) Haslup 110A*
(P) Hidden, and Nitrogen Products Co. .. 688A
(P) Prinz zu Löwenstein, and Hauff 404A
(P) Thorssell and others 544A
Fixation of atmospheric —— in a blast furnace. (P) Haslup 23A*
Fixation of atmospheric —— as cyanide Thorssell 780A
fixation by the electric arc, Theoretical study of ——. Steinmetz 331A
fixation; Equilibrium conditions in the Bucher process of —— Ferguson and Manning 17A
fixation; Furnace for ——:
(P) Crowell, jun., and Nitrogen Products Co. 21A
(P) Hidden, and Nitrogen Products Co. .. 657A
Fixation of —— as hydrogen cyanide by means of an electric arc. Briner and Baerfuss 105A
fixation—a key industry 139R
fixation plant in Dutch East Indies; Proposed ——. 150R
fixation; Symbiotic —— as influenced by the nitrogen in soil Albrecht 553A
fixation in U.S.A 75R
-fixing organisms; Effect of nucleic acid derivatives and —— on plant growth. Bottomley 200A
Gas-volumetric determination of ammoniacal, nitric, and organic —— in mixed fertilisers. Baldi .. 827A
Influence of position of substituents on behaviour of aromatic nitro-compounds in estimation of —— by the Kjeldahl method. Margosches and Vogel 82A
Kjeldahl method for determination of ——. Phelps and Daudt 351A
Kjeldahl's method for determination of —— as applied to gelatin Bennett and Holmes 497A
in leather, Rapid determination of ——. Enna .. 730A
in leather, Sources of error in Kjeldahl determination of —— and modified method of expelling the ammonia Kahn 731A
Manufacture of a mixture of hydrogen and —— for synthesis of ammonia
(P) Ellis and Lutkins 231A
(P) Gerlin and others 656A
(P) Harger 516A
(P) Harburger Chem Werke, and Daltz .. 21A
Manufacture of mixtures of hydrogen and —— by decomposition of ammonia. Davis and Olmstead 362A
Manufacture of technically pure carbon dioxide, hydrogen, and —— from natural gas and air. (P) Herman 267A
and methane, Composition of the vapour and liquid phases of mixtures of ——. McTaggart and Edwards 539A
nitrates, Determination of —— in fertilisers. Moore 579A
nitric; Apparatus for determination of —— by Devarda's method. Erlich 530A
Oxidation of —— in an arc with alternating current. (P) Bergmann Elektrizitätswerke A.-G. 21A
Rate of solution of atmospheric —— in water. Adeney and Becker 702A
Relative availability of nitrate nitrogen and organic —— Blair 379A
Separation of air into oxygen and ——. Norton .. 721A
Synthetic production of compounds of hydrogen and —— (P) Harter and Braun 295A
Use of potassium permanganate in determining —— in fertilisers by the Kjeldahl method. Frear and others 344A
Nitrogen compounds for carbides; Conversion of —— into ammonium compounds. (P) Mewes 404A
compounds, Combination of Solvay ammonia-soda process with processes for manufacturing ——. Hamburger 485A
compounds, Manufacture of ——. (P) Jacobs, and Air Reduction Co 749A
compounds; Manufacture of —— from atmospheric air (P) Sanders and others 656A
compounds; Manufacture of —— from carbides. (P) Carlson, and Aktiebolaget Nitrogenium 450A
compounds; Manufacture of high-phosphorus pig-iron and —— from greensand. (P) Meadows 68A
compounds; Obtaining by-products, particularly —— from blast furnaces. (P) Ostwald, and Chemical Foundation, Inc. 570A

Influence of ester transposition in determination of saponification values of —. Parsee and Reid .. 305A
and the like; Deodorising and purifying —. (P) Calvert 728A
and the like; Treatment of —. (P) Calvert 521A
Manufacture of catalysts for hydrogenating —:
(P) Ellis 790A
(P) Moore, and Brown Co. 791A*
Richardson 459A
(P) Schuck 495A
Manufacture of edible and technical — (P) Byk-Guldenwerke 522A
Manufacture of fullers' earth for refining of —. (P) Kohlndorfer 72A
Manufacture of low-boiling — from higher boiling petroleum and related oils. (P) Cobb, and Standard Oil Co 98A
Manufacture of pale, readily drying — from acid resins from refining of benzene (P) Schummer .. 633A
Manufacture of viscous —. (P) Börner 396A
Manufacture of viscous — readily converted into water-soluble products (P) Tetralin Ges. 623A
Mineral — *See under* Oils, Hydrocarbon.
Neutralisation of — (P) Arbini 551A
Neutralisation of — by esterification of the free fatty acid (P) Schlinck und Co 198A
Obtaining distilled products from — (P) Stapp .. 98A
Obtaining semi-coke and — from coal in rotary distillation apparatus (P) Fischer 56A
Production of fuel and lamp (solar) — from coal. Gluud 223A
Production of — from peat, peat-straw, mosses, lichens, algæ, grass, straw, pine-needles, and the like (P) Von Porat 7A
Production of — from shale and other bituminous minerals (P) Zeller und Gmelin 652A
Purification of — Lach 376A
Rapid determination of water in — Oertel .. 824A
Recovery of — from soap-free waste water. (P) N V Jurgens' Vereen Fabr. 341A
Removal of catalyst poisons from — by means of fullers earth prior to hydrogenation Leno .. 825A
Removing or decreasing objectionable odours from treated — (P) Booge, and Du Pont de Nemours and Co 459A
resistant to changes of temperature Eisenstein .. 663A
Separating — from mixtures by means of continuous distillation and concentration columns. (P) Maschinenbau A.-G. Golzern-Grimma 742A
Separating light — from washing oil (P) Koppers, and Koppers Co 398A
Separating or separating and recovering (and if desired washing) — from water or other liquids (P) Linden 287A
Shale — *See under* Shale
Splitting — with germinating and resting castor seeds. Laiwala 340A
Splitting — for manufacture of glycerin and fatty acids (P) Twitchell Process Co 697A*
Splitting of — by means of castor seed lipase. Sudborough and others 340A
Still for cracking — (P) Gray 290A
Trade of Hongkong in — 311R
Turbidity temperature of —. Parkes 145R
Oils, Essential
Artemisia annua oil; constitution of artemisia ketone. Asahina and Takagi 832A
Artemisia glutinosa oil Bennett 674A
Cassia oil; Rapid estimation of lead in — Lubatti 35T
Chenopodium oil from various sources, Composition of — Nelson 526A
Determination of cineol in — Kleber and Von Rechenberg 763A
Eucalyptus megacarpa oil, Occurrence of terpineno in — Smith 206A
Eucalyptus oil, Determination of cineol in —. Cocking 610A, 832A
Extracting — from peel of citrus fruits. (P) McDermott 765A
Juniperus oxycedrus oil; Chemical characters of —. Huerre 467A
Moslia grosseserrata oil. Murayama 640A
Production of — in Spain 382R
Pseudo-iodine value of — Huerre 206A
Rose oil German extracted — Lize 43A
Rose oil (otto of roses) in Bulgaria 347R
Rutacea multifolia oil Nelson 527A
Sandalwood oil; Australian — 111A
Sandalwood oil in Western Australia 436R
Solvent for extraction of — (P) Tetralin Ges .. 665A
Tea leaf oil; Unsaturated alcohol of —. Van Romburgh 527A
Oils, Fatty
Animal oils; Value of — as sources of vitamin A. Drummond and Coward 798A
Arachis oil, Composition of fatty acids from —. Heiduschka and Felser 272A
Arachis oil trade of Hongkong 44R
Boiled oils; Determining acid value of —. Gardner and Coleman 306A
Bottlenose oil. Fahrion 607A

Oils, Fatty—*continued*.
Candle-nut oils in the paint and varnish industry .. 105R
Castor oil industry. Shrader 202R
Castor oil from plants grown in New South Wales .. 111R
Castor oil production in Queensland 357R
Castor oil; Solubility-relations of —— and petrol from various sources. Atkins 521A
Catalysis applied to hardening of ——. Knapp .. 128R
Change of refractive indices of —— with temperature. Joseph 66T
Channel cat fish oil. Gardner 495A
Chaulmoogra oil; Utilisation of —— 414R
Chia oil. Gardner and Holdt 789A
Chrysalis oil; Characters of ——. Desvergnes 341A
Clupea longiceps oil. Menon 93R
Cucus Benedictus oil. Ferenes 71A
Cockle-burr seed oil. Rhodes 604A
Coconut oil; Rancidity of Philippine ——. Perkins .. 458A
Coconut oil; Solubility of —— in alcohol and acetic acid. Van Kregten 305A
Cod-liver oil; Sulphuric acid test for ——. De Kadt .. 550A
Colchicum seed oil. Grimme 703A
Cottonseed oil; Chemical composition of ——. Jamieson and Baughman 521A
Cottonseed oil; Colour standards for ——. Arny and others 33A
Cottonseed oil; Fat-soluble growth-promoting substance in ——. Daniels and Loughlin 609A
Cottonseed oil presses; Press-plate for ——. (P) Henry, and Murray Co 632A*
Cottonseed oil products; Kreis rancidity reaction of ——. Smith 663A
Determining the Reichert-Meissl-Polenske value of ——. Richmond and Hall 80T
Dika whale oil. Ueno 825A
Drying oils; Thickening of ——. Fritz 121A
Edible oil preparations in dry form. (P) Dunham .. 638A*
Edible oils; Manufacture of ——. (P) Byk-Guldenwerke 522A
Edible oils; Use of refractometer in ascertaining purity of refined —— Trim 307T
Fir-seed oil. Von Friedrichs 304A
Fish oils of Madras Presidency. Menon 93R
Fish oils; Removing the odour from —— (P) Ioka .. 495A
Fish oils; Separation of highly unsaturated fatty acids in ——. Tsujimoto 825A
Gleditschia seed oil. Krys 240A
Hubbard squash seed oil Baughman and Jamieson .. 417A
Hydrogenation of ——. (P) Ellis 551A
Linseed oil; Determination of hexabromide value of ——. Wolff 417A
Linseed oil; Factors affecting oxygen absorption of ——. De Waele 48T
Linseed oil; Hexabromide test of purity of —— .. 604A
Linseed oil; Hydrogenation of ——. Armstrong and Hilditch 663A
Linseed oil; New hexabromide method for ——. Steele and Washburn 197A
Linseed oil substitute; Manufacture of —— (P) Bayer und Co. 165A, 377A
(P) Bene and Esteva 605A
Maize oil; Effect of mould growth on ——. Babak .. 163A
Manufacture of —— of low solubility in petroleum spirit. (P) Chem. Fabr Flörsheim Noerdlinger .. 240A
Marine animal oils; Reactions in hydrogenation of ——. Arents 304A
Okra seed oil. Jamieson and Baughman 417A
Olive oil; Adulteration of —— with tea-seed oil. Cofman-Nicoresti 240A
Olive oil extracted with carbon bisulphide; Determination of oxidised fatty acids in ——. Kadlinger 663A
Olive oil industry in France 217R
Olive oil; Lipolytic enzymes in ——. Rector 304A
Olive oil production in Spain 220R
Olive oil; Refining —— Artmann 120A
Palm-kernel oil; Solubility of —— in alcohol and acetic acid. Van Kregten 305A
Para rubber seed oil 291R
Perilla oil. Gardner and Holdt 789A
Pine-seed oil. Von Friedrich, ... 304A
Polymerisation of ——. Marcusson 755A
Proso millet oil. Dunbar and Blanewlez 346A
Rubber-seed oil in Federated Malay States 381R
Salmon oil. Gardner 494A
Sambucus racemosa berry oil. Thoms 198A
Saponifiable oils; Action of nitric acid on ——. Radcliffe and Polychronis 305A
Schleichera trifuga oil. Sen Gupta 91T
Shark liver oil; Squalene, a highly unsaturated hydrocarbon in ——. Tsujimoto, ... 197A
Shark's egg oil; Occurrence of squalene in ——. Tsujimoto 197A
Soya bean oil. Low 550A
Sulphonated oils; Commercial examination of ——. Pickering 164R, 306T
Sulphonated oils; Determination of moisture in ——. Barber 163A
Sulphonated oils; Determination of sulphate in ——. Kern 698A
Sumac seed oil. Brubaker 33A
Tea-seed oil; Adulteration of olive oil with ——. Cofman-Nicoresti 240A
Theory of polymerisation in ——. Salway 304T

Oils, Fatty—*continued*.
Tobacco seed oil. Preisseckor and Brezina 71A
Tung oil; Influence of content of free fatty acids in valuation of —— by Browne polymerisation test. Jameson 697A
Tung oil; Nitration of ——. (P) Howse 790A
Tung oil; Standard specifications for purity of raw —— 604A
Turkey-red oil; Determination of ammonia in ——. Welwart 727A
Turkey-red oil or the like; Preventing textiles treated with —— acquiring a yellow tint. (P) Boehringer Sohn 817A
Turkey-red oil; Manufacture of a substitute for ——. (P) Chem. Fabr. Flörsheim Noerdlinger 164A
Vegetable oils industry; Progress of —— in 1919. Warburton 8R
Vegetable oil market in Holland 119R
Vegetable oil products in Trinidad 221R
Vegetable oil resources of Shanghai District, China .. 312R
Vegetable oil trade of Kobe (Japan) 99R
Vegetable oils; Detection of minute quantities of petroleum spirit in ——. Aida 152T
Vegetable oils; French trade in —— 445R
Vegetable oils; Japanese trade in —— 445R
Vegetable oils; Nitration of ——. (P) Howse .. 790A
Vegetable oils in Palestine 95R
Vegetable oils; Refining ——. (P) Riley, and Clark, MacMullen, and Riley 34A
Vegetable oils in South Africa 148R
Vegetable oils; Value of —— as sources of vitamin A. Drummond and Coward 798A
Vulcanised oils; Treatment of ——. (P) Snelling .. 697A
Whale oil; Hydrogenated ——. Buttenberg and Angerhausen 121A
Whale oil, Use of hydrogenated —— as food. Thoms and Möller 131A
Yellow-tail fish oil. Gardner and Reilly 304A

Oils, Hydrocarbon:
Apparatus for decomposing water and ——. (P) Wade, and Wadol Corp. 396A
Apparatus for treating ——. (P) Brownlee 510A
Calculating viscosity of mixtures of ——. Espy .. 5A
Condensing and treating distillates of ——. (P) Fleming, and Fleming Co. 149A
Continuous cracking of ——. (P) Price and Dietz .. 652A
Cracked oils; Refining ——. (P) Leslie and others.. 440A
Cracking of —— (P) Emerson 651A
Crude oil; Centrifugal separators for ——. (P) Estep and Henry 215A
Crude oil and the like; Separation of water and other impurities from ——. (P) Billwiller 815A
"Gas-oil"; Manufacture of ——. (P) Ellis, and Ellis-Foster Co 651A
Mineral oil indications in Australia 256R
Mineral oil industry in Australia; State assistance for development of—— 339R
Mineral oil industry, Progress of —— in 1919. Dunstan 3R
Mineral oil products, Determination of iodine value of —— Röderer 741A
Mineral oil refining, Recovery of waste acids from ——. Kolbe 438A
Mineral oil sludge; Recovering sulphonic acids from ——. (P) Divine, and Twitchell Process Co. .. 260A
Mineral oils, Apparatus for cracking ——. (P) Poole, and Poole Oil Cracking and Refining Co. 510A
(P) Wellman, and Kansas City Gasoline Co. 440A
Mineral oils; Apparatus for distillation of ——: (P) Faust, and International Gasoline Process Corp. 510A
(P) Stone 684A
Mineral oils, Apparatus for producing hydrochloric acid from sludge acid from treatment of ——. (P) Lasher, and Kansas City Refining Co. .. 437A
Mineral oils; Apparatus for refining ——: (P) Jones, and Kansas City Gasoline Co .. 396A
(P) Wellman, and Kansas City Gasoline Co. 440A, 651A
Mineral oils; Apparatus for separating composite ——. (P) Van Tilburg 149A
Mineral oils; Calculation of viscosity of a mixture of two —— from viscosities of its components. Schwedhelm 660A
Mineral oils; Converting —— into higher boiling products. (P) North 506A
Mineral oils; Determination of specific heat of heavy ——. Bailly and Edwards 683A
Mineral oils; Determination of sulphur in —— by the lamp method: Eaking 434R
Jackson and Kewley 413R
Mineral oils; Evaporator for distilling ——. (P) Meiselbe-Smith, and Shell Co. of California .. 182A
Mineral oils; Freezing point of ——. Lantos .. 96A
Mineral oils of high boiling point; Converting —— into products of lower boiling points. (P) Koutschan, and Chemical Foundation, Inc. 98A
Mineral oils; Improving ——. (P) McAfee, and Gulf Refining Co. 149A
Mineral oils; Manufacture of hydrochloric acid from acid sludge from refining of ——. (P) Lasher, and Kansas City Refining Co. 404A, 404A

Oils, Hydrocarbon—*continued*.
Mineral oils; Manufacture of paint vehicles from ——. (P) Soukup 728A
Mineral oils; Manufacture of sulphonated products of ——. (P) Twitchell Process Co. 540A*
Mineral oils; Manufacture of sulphonic acids of ——. (P) Twitchell Process Co. 540A*
Mineral oils; Obtaining lubricating oils from —— by means of sulphurous acid. (P) Allgem. Ges. für Chem. Ind. 290A
Mineral oils; Preparation of fullers' earth for treatment of ——. Phalen 97A
Mineral oils; Preparation of hydrocarbons and organic oxygen compounds from chlorinated products of ——. (P) Berglus and Landsberg 385A
Mineral oils; Proposed institute for technology of —— in Germany 238B
Mineral oils; Refining ——. (P) Wellman, and Kansas City Gasoline Co. 651A
Mineral oils; Refining —— by distillation. (P) Forward 651A
Mineral oils; Removal of aromatic hydrocarbons from —— by means of trioxymethylene-sulphuric acid. Tauss 147A
Mineral oils; Substitute for —— from tar oils for use in switches and transformers. (P) Tetralin Ges. .. 440A
Mineral oils; Treatment of ——. (P) Johnson .. 716A
Mineral oils which have been treated with sulphuric acid; Neutralising ——. (P) Grisard 776A
System for cracking ——. (P) Wellman and others.. 440A
Treatment of ——. (P) Brownlee 7A
Okra seed; Fatty oil of ——. Jamieson and Baughman.. 417A
Oleaginous substances; Extracting —— from materials containing them. (P) MacGregor and Austin .. 697A*
Oleates of certain metals. Albuquerque 240A
Oleic acid; Isobutyl ester of —— (P) Preiswerk, and Hoffmann-La Roche Chemical Works 135A*
Oleo-resins. *See under* Resins.
Oleum; "Heat-rise" method of testing ——. Curtis and Miles 64T
Olive oil. *See under* Oils, Fatty.
Onion; Water-soluble vitamin B in ——. Whipple .. 830A
Ontario. *See under* Canada.
Opium assay. Dott 347A
Determination of morphine in ——. Jernstad .. 761A
Exports of —— from India 187R
and its preparations; Determination of morphine in ——. Rapp 425A
preparations, Determination of total subsidiary alkaloids and of narcotine and papaverine in ——. Anneler 800A
Optical isomers; Properties of —— from the biological side. Cushny 41A
Optical Society 34R
Orange juice; Inversion of sucrose in ——. André .. 245A
Oranges; Inversion of sucrose during preservation of ——. André 204A
Treatment of ——. (P) Henius and Mendelsohn .. 581A
Ore-bearing materials; Machine for separating minerals from —— (P) Park 339A*
briquettes; Continuous regenerative gas-fired kilns for burning ——. (P) Priest 773A
briquetted, Manufacture of —— (P) Hills and Wheeler 238A
concentrates; Apparatus for sintering ——. (P) Berglund 118A
concentrates; Roasting ——. (P) Tainton 373A*
-flotation agent; Manufacture of an ——. (P) Cannon and others 788A
flotation; Effect of addition agents in ——. Thornberry and Mann 787A
Ores; Annular mechanical furnace for roasting ——. (P) Promnitz and others 788A
Apparatus for agglomerating ——. (P) Davis .. 694A
Apparatus for concentration of ——:
(P) Lyster, and Minerals Separation North American Corp. 695A*
(P) Richardson 576A*
Apparatus for desulphurising and treating ——. (P) Foss, and Foss International Ore Reduction Co. .. 493A
Apparatus for lixiviating and washing granular or pulverulent ——. (P) Gröndal 239A
Apparatus for roasting or sintering ——. (P) Greenawalt 754A*
Apparatus for separating ——. (P) Jones 161A
Apparatus for separating fine —— (P) Draper .. 54A*
bituminous; Retort ovens for distillation of ——. (P) Hauser 327A
Briquetting ——. (P) Vogel, and General Briquetting Co. 754A
Chemical separation of ——. (P) Elliott and Freeman 239A
Chlorids volatilisation experiments on Utah ——. .. 194A
Concentrating ——:
(P) Callow, and Pneumatic Process Flotation Co. 239A
(P) Edser and Sulman 162A*
(P) Edser and others 458A*

industry; British ——. Murray (British Oxygen Co) 54R
liquid, Apparatus for producing ——. (P) Crommett and others 722A
liquid; Explosives with —— Thorburn 317R
Manufacture of supersaturated solutions of ——. (P) Sarason 783A
Micro-analytical determination of carbon dioxide, combustible gases, and ——. Schmit-Jensen .. 316A
plants in Canada, New —— 147R
Rate of solution of atmospheric —— in water. Adeney and Becker 702A
Reaction of —— with charcoal Lowry and Hulett . 696A
Separation of air into nitrogen and —— Norton . 721A
Use of —— in gas production Hodsman and Cobb 200R, 508A
-yielding detergents; Manufacture of ——. (P) Möhring 418A
Oxyhydrogen gas, Catalysis of —— by palladium mixed crystals Tammann 515A
Ozokerite, Determination of paraffin wax in ——. Koss . 741A
Ozonisers, Electric ——. (P) Franklin, and General Electric Co 416A
Ozonising apparatus. (P) Baveux and Richard 163A*

P

Packing, Heat-resisting —— (P) Stromeyer 274A
materials resistant to chlorine, Manufacture of ——. (P) Wallace and Tiernan 214A
Tubular —— for absorption apparatus (P) Deutsche Ton und Steinzeugwerke A.-G. 54A
Paint containers, Composition of air in ——. Gardner and Rector 605A
industry in Canada 347R
industry, Candle-nut oils in the —— 105R
manufacture, Bulking values and yields of pigments and liquids used in —— Gardner and Parks .. 356R
media, Manufacture of antiseptic and preservative ——. (P) Chem Fabr Flörsheim Noerdlinger .. 637A
oils suitable for cement and concrete; Manufacture of —— (P) Boehm, Ltd, and Reihl 241A
as a plastic material, not a viscous liquid: measurement of its mobility and yield value Bingham and Green 495A
vehicles, Manufacture of —— from mineral oils. (P) Soukup 728A
Painted articles, Drying ——. (P) Cunliffe, and American Blower Co 241A
Painting compositions, Manufacture of ——. (P) Flakes A.S., and Schou 377A
Paints; Colloid chemistry of —— Morrell 73R
containing zinc oxide, linseed oil, and zinc oxychloride, Manufacture of (P) Witherich 633A
Hiding power of white —— Pfund 34A
Illumination from —— Gardner 72A
Instrument for measuring the hiding power of ——. Hallett 632A
lacquer-, Manufacture of quick-drying ——. (P) Deutsch-Luxemburgische Bergwerks- und Hütten-A.-G., and Hilpert 792A
Manufacture of ——:
(P) Goldthorpe 35A*
(P) Isaacs 607A
(P) Koppers Co., and Darrin 757A*
(P) Schneider 757A*
(P) Wingen 522A*
Manufacture of antifouling —— for ships' bottoms. (P) Arlé 495A
Manufacture of —— especially for use as undercoats. (P) Wright 241A
Manufacture of a substance suitable for producing durable —— for wood. (P) Fuchs 665A
Manufacture of —— from tar and slaked lime. (P) Klement 665A
for metals and other materials. (P) Ivinson and Roberts 757A*

Paints—*continued*.
for ships' bottoms etc. (P) Burstin 665A
Toxicity of lead —— 169R
Waterproof ——. (P) Kuroki and Nakayama 38A, 342A*
Palestine; Vegetable oils in —— 95R
Palladium; Ageing of colloidal ——. De Rocasolano .. 626A
-black; Dehydrogenation of hydrocarbons by means of ——. Tausz and Von Putnoky 54A
-gold mixed crystals; Catalysis of oxyhydrogen gas by ——. Tammann 515A
Influence of hydrogen sulphide on occlusion of hydrogen by ——. Maxted 782A
-silver mixed crystals; Catalysis of oxyhydrogen gas by ——. Tammann 515A
Sorption of hydrogen by —— at low temperatures. Firth 363A
Palm-kernel oil. *See under* Oils, Fatty.
Palm kernels; Restrictions on trade in —— 18R
Palmetto leaves; Commercial value of —— 59R
Pancreatic amylase preparations; Proteolytic activity of ——. Sherman and Neun 37A
Panicum miliaceum. *See* Proso millet.
Pantopon; Determination of total subsidiary alkaloids and of narcotine and papaverine in ——. Anneler .. 800A
Papaverine; Determination of —— in opium preparations. Anneler 800A
Paper; Apparatus for making ——. (P) Murphy and others 14A
Apparatus for making ornamental ——. (P) Mahler, and Kimberly Clark Co. 264A
board; Manufacture of ——:
(P) Cedaroid Co 103A
(P) Clapp, and Metallic Co 361A
or board, Manufacture of easily folded ——. (P) Voith 227A
and boards, Sizing and waterproofing —— (P) Altmann 361A
Carbon —— and ink composition therefor. (P) Ohashi 264A
-coating machines (P) Mayer 60A*
Colloidal rosin in beater sizing of —— Traquair .. 444A
containing mucilage, Hygroscopic properties of —— Schwalbe and Becker 330A
Determination of dextrins in the presence of beater starch in ——. Kamm and Tendick 102A
Determination of mixed pulp in newsprint —— .. 12A
Doll-head bearings for cylinders of drying machines for —— (P) Holt and Malone 153A*
Drying —— in continuous strips (P) Mallick .. 153A
Drying —— in sheet form (P) Minton 779A*
fabrics; Impregnating ——. (P) Gebr. Heyl und Co 104A
fabrics, Improving —— (P) Exportingenieure für Papier- und Zellstofftechnik 185A
felt for roofing or the like; Manufacture of ——. (P) Barrett Co 361A*
Fixing and blackening pencil drawings on ——. (P) Grunert 377A
industries; Rendering waste from —— absorbent (P) Reis und Co 185A
industry in Canada 290R
industry in Italy 340R
and like containers; Impregnating —— and subsequently draining (P) Shirlow 331A*
and the like. Continuous beating and refining engine for use in manufacture of —— (P) Nash .. 60A
and the like, Machines for manufacture of —— (P) Thiry 654A*
and the like; Production of a paste for manufacture of ——. (P) Lottero 513A
and the like, Sizing, waterproofing, dressing, etc ——. (P) Schmidt and Heuser 653A
Machines for drying varnished or gummed sheets of ——. (P) Bush and Bush 445A*
Machines for impregnating —— (P) Mayer 361A*
Making lines and water-marks on —— (P) Suursalmi, and Kangas Pappersbruks Aktiebolag .. 186A
-making machines (P) Haug, and Improved Paper Machinery Co 541A*

Manufacture of ——:
(P) Cedaroid Co. 103A
(P) Imaoka 361A
(P) Pope, and Great Northern Paper Co. 654A, 719A*, 817A
Manufacture of aluminium compounds for sizing —— 517A, 779A
(P) Muth 361A
Manufacture of dense strong ——. (P) Schwalbe 514A, 779A
Manufacture of emulsions for sizing ——. (P) Muth .. 361A
Manufacture of hard-sized —— (P) Ruff 15A
Manufacture of size for —— (P) Mitscherlich .. 264A
Manufacture of —— from textile fibres from raw plants. (P) Nesselanbau Ges. 400A
Manufacture of thread, twine, or cord from ——. (P) Grant 153A*
manufacture; Treating sea-tang for ——. (P) Frydensberg 16A*
Material for sizing —— obtained from cellulose waste lyes. (P) Michl 779A
Obtaining lignin substances suitable for sizing —— from lignin-sulphonic acids of sulphite-cellulose waste lyes (P) Feldmühle Papier und Zellstoffwerke A.-G 16A
and paper fabrics; Rendering —— grease- and water-proof (P) Buchbinder 653A
paper pulps, and paper yarns and fabrics; Sizing and waterproofing —— (P) Fues and Braunmüller .. 653A
parchment-, Manufacture of ——.
(P) Dagnall 331A*
(P) Hoering 653A
parchmentised, Manufacture of —— (P) Clayton and others 331A*
Perishing of —— in Indian libraries Sudborough and Mehta 93R
Photographic —— *See under* Photographic.
plant in New South Wales; Government —— 111R
production in Czecho-Slovakia 400R
Production of sewing or basting thread from ——. (P) Vohwinkler Papier- u Salicyl-Pergamentpaper-Ind 226A
pulp, Beating and refining engine for —— (P) Nash 686A*
pulp, Colouring of —— for textile purposes Puschel 12A
pulp, Colouring —— with thiophor dyestuffs (P) Jäger 60A
pulp, Cooking cottonseed hull fibre for ——. Kress .. 263A
pulp, Curtailment of bleaching powder consumption by addition of sulphur to digester liquor in manufacture of ——. Spence 686A
pulp, Dyeing —— with insoluble artificial colouring matters (P) Meister, Lucius, u Brüning .. 331A
pulp, Engine-sizing of ——. (P) Zellkoll Ges. .. 264A
pulp from flax straw 443A
and pulp industry in Canada 398R
pulp, Influence of temperature on rate of draining of —— Smith 12A
pulp; Machines for straining —— (P) Watford Engineering Works, Ltd, and Paramor 16A*
pulp, Manufacture of —— (P) Skinner 227A
pulp manufacture; Recovery of alkali from "black liquor" obtained in —— Moore 444A
pulp, Mucilage of parchment —— Seibert and Minor 686A
pulp, Separators for ——. (P) White 331A*
pulp; Straining apparatus for use in manufacture of —— (P) Martin, and Lloyd, Ltd 595A*
pulp, Treatment of ——
(P) De Cew and Marx 153A*
(P) Howard 15A
pulp, Treatment of straw and the like for manufacture of —— (P) Werner 624A
pulp, Tub beaters for ——. (P) Grilley-Unkle Engineering Co 595A*
pulp *See also* under Pulp
Removal of ink from writing ——. (P) Gethe .. 654A
Removing mineral matter from ——. (P) Nakamura, and Nippon Sen-I Kogyo Kabushiki Kaisha .. 15A
Re-pulping old or waste ——. (P) Burby 264A
Safety —— (P) Haussmann 264A
from seaweed pulp 14R
size, Manufacture of ——. (P) De Cew 103A
size, Treatment of —— (P) De Cew 103A
Sizing ——
(P) Feldmühle Papier und Zellstoffwerke A.-G. 15A
(P) Holzverkohlungsind. A.-G 60A
(P) Ruff 227A

textiles; Sizing and waterproofing ——. (P) Altmann 361A
textiles; Waterproof impregnation of ——. (P) Linke 103A
trade in South Africa 148R
for use as dielectric for electrical condensers and other purposes. (P) Haigh 292A
waste; Manufacture of cleaning material from ——. (P) Reis und Co. 15A, 227A
waterproof; Manufacture of ——:
(P) Clapp 595A
(P) De Cew 103A
(P) Kirschbraun 719A*
(P) Wandrowsky 779A
Waterproofing ——. (P) Böhme A.-G. 292A
yarn; Apparatus for drying ——. (P) Jagenberg .. 263A
yarn and cloth; Dyeing ——. (P) Chem. Fabr. Coswig-Anhalt 186A
yarn fabrics; Compacting ——. (P) Rawitscher .. 103A
yarn; Prevention of mould growth on ——. (P) Sarason 400A
yarn; Process for strengthening ——. (P) Ruff .. 15A
yarns and fabrics; Bleaching ——. (P) Jagenberg .. 400A
yarns and fabrics; Dyeing —— with substantive colours. (P) Chem. Fabr Coswig-Anhalt 154A
yarns or fabrics; Impregnating ——:
(P) Deutsche Pyroxitges. 445A
(P) Ruff and Praetorius 226A
yarns and fabrics treated with phenol-formaldehyde condensation products; Dyeing ——. (P) Ruff .. 229A
yarns; Softening ——. (P) Hasenbring 103A
yarns and textiles; Softening ——. (P) Bennert .. 330A
Papier-maché; Manufacture of pulp for making ——. (P) Skinner 227A
Papua; Natural petroleum from ——. Read and Andrews 269T
Para cress; Spilanthol, the pungent principle of ——. Asahina and Asano 672A
Para Red. *See under* Azo dyestuffs.
Para rubber seed oil. *See under* Oils, Fatty.
Paracoumarone. *See under* Coumarone.
Paraffin; Algebraic method for detecting —— in ceresin. Smelkus 358A
hydrocarbons; Uniform movement of flame in mixtures of air with —— Payman 95A
oil; Effect of addition of fatty acids on interfacial tension between mercury and ——. Bhatnagar and Garner 185T
oils; Obtaining motor fuel and light ——from shale. (P) Thurlow 539A
Oxidation of ——. Kelber 220A
Producing cakes of solid crude ——. (P) Szekely .. 221A
Production of —— from coal. Fischer and Gluud .. 223A
Production of —— from peat, peat-straw, mosses, lichens, algæ, grass, straw, pine-needles, and the like. (P) Von Porat 7A
Thermal expansion of, and specific gravity of solutions of ——. Von Piotrowski 5A
wax candles; Manufacture of ——. Lach 775A
wax crystallising in scales; Purifying crude —— by sweating. (P) Bartusch 716A
wax; Determination of —— in ozokerite. Koss .. 741A
wax; Expressing —— from petroleum distillates. (P) Wells and Wells 684A
wax; Extraction of ——. (P) Nichols, and Atlantic Refining Co. 814A
wax; Influence of high temperatures on ——. Burstin and Jakubowicz 325A, 741A
wax; Manufacture of high-grade viscous lubricating oil and —— from high-boiling fractions of gas-producer and low-temperature retort tars. (P) Allgem. Ges. f. Chem. Ind. 327A
wax; New sweating process for ——. Székely .. 438A
wax; Oxidation of —— by oxygen. Kelber .. 714A
wax; Refractometric determination of —— as control test in manufacturing process. Freund and Falik 650A
wax; Separating —— from mineral oils. (P) Sharples 682A
wax; Separating —— in treatment of hydrocarbon mixtures with liquid sulphur dioxide. (P) Allgem. Ges. für Chem. Ind. 716A
wax; Separation of —— from neutral oil and oxygen-containing constituent of producer- or low-temperature tar. (P) Allgem Ges für Chem. Ind. .. 652A
wax; Solid —— found in Lancashire coal. Stanait and Barash 289A
wax; Synthesis of fatty acids from ——. Löff .. 604A
wax; Technique of crystallisation in manufacture of ——. Fuchs 220A
Paraffins; Determination of —— in commercial toluol:
Colman 50T
Lewis 50T
Fatty acids obtained by oxidation of ——. Fischer and Schneider 521A
Liquid —— of lamp oil fraction of low-temperature coal tar. Fischer and Gluud 523A
Oxidation of —— to fatty acids etc. Orth 521A
Paraguay; Sugar industry in —— 115R
Trade of —— in 1919 .. .. 348R
Paraldehyde; Determination of acetaldehyde in ——. Stève 764A
Manufacture of ——. (P) Konsortium für Elektrochem. Ind. 467A
Manufacture of acetic acid from ——. (P) Soc. des Aciéries et Forges de Firminy 527A

Paraldehyde—*continued.*
Manufacture of ethyl acetate from ——. (P) Soc. des Aciéries et Forges de Firminy 527A
Parasites; Destroying —— and increasing germinating power of seeds. (P) Traube 759A
Parliamentary news. 18R, 70R, 96R, 100R, 116R, 135R, 151R, 186R, 205R, 223R, 239R, 258R, 276R, 294R, 361R, 384R, 401R, 419R, 439R
Pasteboard; Drying —— in continuous strips. (P) Mälicke 153A
Mechanical process for obtaining fibres for manufacture of —— suitable for saturating with tar for roofings, linings, etc. (P) Kron 483A*
pulp; Engine-sizing of ——. (P) Zellkoll Ges. .. 264A
Pasteurisers and evaporators. (P) Ruff 733A
Pasteurising apparatus. (P) Buass 831A
liquids. (P) Mülerts 311A
Pasty materials; Apparatus for granulating or finely dividing semi-fluid or ——. (P) MacLachlan .. 39A
Patent rights; Italian —— and the war 291R
rights; Prolongation of French —— 74R
Patents; Chemical —— with special reference to Canadian patent law. MacRae 109R, 176R
Patents and Designs Act, 1919 .. .. 40R
Patents and Designs Acts, 1917 and 1919 .. .. 117R, 172R
Patents and Designs Bill 19R
Patents, designs, and trade marks; Thirty-seventh report on —— for 1919, by the Comptroller-General .. 292R
by Government servants 240R
Lists of ——. 48A, 87A, 140A, 176A, 210A, 251A, 284A, 318A, 352A, 387A, 432A, 471A, 503A, 531A, 559A, 586A, 614A, 643A, 678A, 708A, 735A, 769A, 804A, 837A
Proposed extension of life of German —— 58R
in Sweden 291R
Paving material; Manufacture of fibrous ——. (P) Henderson 659A
materials; Manufacture of ——.
(P) Bünte and North 26A
(P) Honda 750A
and other purposes; Composition for ——. (P) Murray 193A
Peanut oil. *See* Arachis oil *under* Oils, Fatty.
Pea-pods; Fibrous material from ——. (P) Pöhler .. 165A
Pearl, mother of; Manufacture of glass resembling ——. Schwarzbach 490A
Pearls, artificial; Manufacture of —— and of jewellery. (P) Murakami 819A
Peas; Preserving ——. (P) Bruff 525A*
Peat; Action of various fertilisers made from ——. Tacke 75A
Apparatus for extracting liquid from fresh ——. (P) Thåberg 773A
briquettes; Manufacture of ——. (P) Pästerer .. 55A
Carbonisation of —— by treatment under pressure and heat in presence of liquids. (P) Billwiller .. 815A
Carbonising oven for ——. (P) Schröter 395A
Dehydrating ——
(P) Bouillon 358A
(P) Hindshaw 358A
Determination of grade of ——. Keppeler 294A
Disintegrating and extracting liquid from moist ——. (P) Meiser 565A
Distillation of ——. (P) Francke 56A
Dryers for ——. (P) Jackson 358A
Extraction of —— with dry and moist benzene under pressure. Fischer and Kleinstück 218A
fuel, Manufacture of ——:
(P) De Long 776A*
(P) Edgeworth 622A*
(P) Nellsen 622A*
fuel; Manufacture of —— from damp peat as dug from bog strata. (P) Davidson 5A
Gasifying —— (P) Elektro-Osmose A.-G. 826A
Manufacture of ammonia and combustible gas or coke from ——. (P) Bauer 6A
Manufacture of cellulose from ——. (P) Hildebrandt .. 227A
mass; Treatment of —— and production of briquettes. (P) Ulmann 714A
moss; Digestibility of —— after treatment with acids. Godden 797A
moss fibres; Converting —— into a condition suitable for spinning. (P) Deelen 330A
Preparation of damp —— for manufacture of producer-gas (P) Davidson 55A
Production of paraffin, waxes, oils, or fats from peat-straw or ——. (P) Von Porat 7A
resources of Ireland. Purcell 213R
soils; Hysteresis of aqueous solutions of ——. Puchner 125A
Treatment of ——:
(P) Blair 684A
(P) Gruhl 358A
(P) Olsson 650A
in U.S.A. in 1918 .. .. 148R
Wet-carbonising ——. (P) Textrup, and Wet-carbonising, Ltd. 84A
Pectins in various plants. Horaby 246T
Pelletierine. Tanret 668A
Pelt; Biological and chemical history of ——. Relation of elastin to tanning process. Möller 38A

in France 92R
Genesis of —— as revealed by its nitrogenous constituents. Mabery 4A
in Great Britain 186R
Handling of —— in bulk at Thames Haven. Anfilogoff 138T
hydrocarbons; Apparatus for cracking ——. (P) Coast, jun., and Process Co. 742A
hydrocarbons, Treatment of ——. (P) Gray .. 651A
industry, Economics of the ——. Dickie 106R
industry of Rumania 439R
industry; Training course for —— in France 338R
industry, Working up of waste products in the ——. Albrecht 358A
Institute; American —— 14R
investigations in U.S.A. 113R
Java; Catalytic hydrogenation of lævo-rotatory fractions of ——. Steinkopf and Beiersdorf 683A
and like oils; Treatment of ——. (P) Wynne .. .. 684A•
Manufacture of dyestuffs from ——. (P) Frasch .. 511A
Manufacture of liquid fuel from ——. (P) Standard Oil Co. 651A
Obtaining distilled products from ——. (P) Stapp .. 98A
Occurrence of naphthenes in Galician ——. Skowronski 438A
oil-field emulsions. Sherrick 289A
oil-fields of Argentina, Transfer of —— 439R
oil-fields of Canada 419R
oil-fields, Geology of the Mexican ——. Brennan .. 394R
oil fractions; Preparation of fatty acids for soap from —— Ubbelohde and Eisenstein 459A
oils; Determination of sulphur in ——. Waters .. 438A
oils; Distillation of ——. (P) Humphreys and others 651A
oils; Manufacture of low-boiling oils from higher boiling —— (P) Cobb, and Standard Oil Co. .. 98A
oils, Purification of ——. (P) Hood 651A
oils; Rapid determination of aromatic hydrocarbons in light ——. Hess 509A
oils; Rapid determination of sulphur in ——. Christie and Bisson 324A
oils; Utilisation of asphaltic base acid sludge obtained in refining —— Baskerville 182A
Origin of —— 170R
Origin of ——: its formation from free fatty acids or soaps and from animal hydrocarbons. Grün and Wirth 564A
Papuan natural ——. Read and Andrews 298T
pitch, Destructive distillation of ——. (P) Noml .. 8A
production in Echigo, Japan 289R
Production of light —— from coal. Fischer and Gluud 223A
production in Mexico 115R, 239R
production in Trinidad 95R
products; Apparatus for treating ——. (P) Jenkins .. 7A
products; Laboratory distillation of ——. Fördas .. 220A
products; Manufacture of high-grade low-boiling ——. (P) McAfee, and Gulf Refining Co. .. .. 149A•
Rectification of ——. Masfaraud 304T
reduction, Process of ——. (P) Kormann and Hull .. 326A
Refining —— with sulphuric acid. Mallet 537A
Relations between asphalt and coke content of ——. Steinkopf and Winternitz 683A
residues; Manufacture of rich gas by means of ——. (P) Soc. de Chimie et Catalyse Ind. 358A
resources of the British Empire. Cadman 214R
spirit; Conversion of high-boiling hydrocarbons into —— and of unsaturated into saturated hydrocarbons. (P) Bergius, and A.-G. für Petroleum-Ind. 222A
spirit; Detection of minute quantities of —— in vegetable oils. Alda 152T
spirit; Determination of aromatic hydrocarbons in ——. Hess 565A
spirit; Determination of —— in turpentine oil. Allina and Salvaterra 697A
spirit; Elimination of danger of ignition of electrically charged ——. Holde 96A

Petroleum—*continued.*
spirit; Manufacture of —— from natural gas or other purified gases. (P) Apparate-Vertriebs Ges. .. 814A
spirit; Preparation of trinitrotoluene from ——. Berl and Ziffer 84A
spirit; Rectified —— from toluene-petrol fraction of Borneo petroleum. Silvester 187T
spirit. *See also* Gasoline *and* Petrol.
Still for distillation of heavy hydrocarbons of ——. (P) Steinschneider 440A
Suggested utilisation of —— at the oilfields in France 380R
supplies; Anglo-French agreement in regard to —— 278R
supplies in France 149R
in Trinidad 257R
vapours; Heat exchanger for condensing ——. (P) Irinyi 810A
Vegetable growth in soils containing ——. Carr .. 200A
and the war. Cadman 145R
Phaseolus lunatus beans; Hydrocyanic acid in ——: Koenig 525A
Lübrig 277A, 382A
Phenacyl bromide; Injurious action of —— on the skin Cox 832A
p-Phenetoleurea; Alteration in taste of —— as a result of chemical change. Thoms and Netteshelm .. 557A
Detection of —— in beer Baumann 463A
Manufacture of ——. (P) Riedel A.-G. 44A
Phenol, Colour test for —— Escalch 642A
content of low-temperature tar and overheated tars. Fischer and Breuer 261A
Dehydration of aqueous —— by distillation (P) Kubierschky 480A
Determination of —— in presence of certain other phenols Chapin 652A
Determination of small quantities of —— in mixtures of phenols. Fischer and Breuer 261A
and homologues, Diazometric determination of ——. Chapin 567A
Manufacture of —— in a continuous high-pressure autoclave. Brown 897A
Manufacture of resinous condensation products of formaldehyde and ——
(P) Albert and Berend 274A
(P) Robinson, and Damard Lacquer Co .. 164A
(P) Weller and Robinson-Bindley .. 792A
Recovery of —— from spent liquors Dawson .. 89R
"Springing" of "carbolate" and recovery of —— from the resulting aqueous liquor Dawson .. 151T
Toxicity towards anthrax and staphylococcus of solutions containing sodium chloride and ——. Lemon 709A
Phenolic condensation products; Manufacture of ——
(P) Nash 552A
(P) Redman and others 460A, 605A
condensation products; Preserving —— from discoloration (P) Redman and others 605A
substances, Purification of liquids containing ——
(P) Basore, and Koppers Co 80A
(P) Davis and others 80A
(P) Dieterle and others 80A
Phenolphthalein; Iodometric determination of —— Palkin 673A
Manufacture of combinations of alkali carbonates and ——. (P) Von Sztankay, and Chemical Foundation, Inc. 834A*
Phenols; Action of arsenic acid on polyhydric —— Sonn 82A
Condensation of phthalic anhydride with —— in presence of aluminium chloride. Ullmann and Schmidt 58A
Conductometric titration of ——. Kolthoff 717A
Determination of —— in drainage from tarred roads Fox and Gange 260T
Determination of small quantities of phenol in mixtures of ——. Fischer and Breuer 261A
Hydrolysis of phenoxyacetic acid with alkali and preparation of pure —— Fischer and Gluud .. 261A
Identification of —— Lyman and Reid 328A
of low-temperature coal tar
I. Cresols Gluud and Breuer 150A
II Catechol Gluud 151A
Manufacture of ——. (P) Marsh 582A
Manufacture of resinous condensation products from formaldehyde and —— (P) Chem. Fabr Albert, and Berend 122A
Manufacture of sulphonates of aromatic hydrocarbons for use in making —— (P) Cobelitz 9A*
as mordant dyestuffs Möhlau 57A
Properties and uses of products containing —— obtained by direct distillation of low-temperature coal tar Fischer and Gluud 150A
Removing —— from water or other liquids (P) Leggett, and Ozone Co. of America 540A
and their substitution products, Manufacture of —— (P) Zolfinger and Roehling 9A
Synthesis of humic acids from ——. Eller and Koch 717A
U.S. Government method of determining —— in sheep dips. Edwards and Freak 326T
Phenolsulphonic acids; Rapid analysis of ——. Deavergnes 599A
Phenoltrisulphonic acid and its conversion into picric acid. Marqueyrol and Carré 350A
Phenoxyacetic acid; Hydrolysis of —— with alkali and preparation of pure phenols. Fischer and Gluud 261A

Phenylated aminohydrindenecarboxylic acids; Manufacture of ——. (P) Chem. Werke Grenzach A.-G. .. 802A
Phenyl derivatives of arsenious acid; Iodometric determination of ——. Fleury 638A
p-Phenylenediamine; Preparation of —— from *p*-dichlorobenzene. Quick 480A
Phenylmethylmalonylurea; Microchemical reactions of ——. Van Itallie and Van der Veen 173A
Phenylphenylenearsinic acid, a by-product in the diazosynthesis of aromatic arsinic acids. Schmidt .. 703A
2-Phenylquinoline-4-carboxylic acid allyl ester; Manufacture of ——. (P) Soc. Chem. Ind. in Basle 704A, 802A*
Philippine Islands; Sugar industry of —— 14R
Phloroacetophenone. Sen and Ghosh 225A
Phloroglucinol reagent; Method of preparing —— for Kreis rancidity test. Dixon 341A
Phosphate; Acid ——. *See* Superphosphate
deposits in Morocco 320R
deposits of Nauru Island; Exploitation of —— .. 224R
deposits of Pacific Islands 41R
deposits in Society Islands 321R
production in French North Africa 438R
rock; Composting of sulphur and ——. Ellett and Harris 793A
rock, Effect of oxidation of sulphur in soils on solubility of —— Shedd 166A
rock, Manufacture of phosphoric acid from —— in a fuel-fed furnace Waggaman and Turley 595A
rock in U.S.A. in 1918 .. .. 168R
Phosphates in basic slag, Solubility in citric acid of ——. Kayser 793A
citrate-soluble; Saccharification of cellulosic materials with simultaneous recovery of ——. (P) Chem. Fabr Rhenania A.-G., and others 463A
Conductometric titration of —— Kolthoff 735A
Decomposition of —— with bisulphate for production of superphosphate. Neumann and Kleykein 378A
Detection of inorganic —— in glycerophosphates. Lizius 266R, 610A
Detection of manganese and zinc in presence of —— Schmidt 530A
of heavy metals, Determination of phosphoric acid in —— Seeligmann 626A
Influence of initial reaction on oxidation of sulphur and formation of available —— in soils Lipman and Joffe 793A
Investigation of mixtures of carbonates and —— by means of capillarily active indicators of acid and alkaline nature Windisch and Dietrich .. 524A
Manufacture of alkali hydrogen —— (P) Sadtler 819A
Manufacture of soluble —— from crude phosphates (P) Chem Fabr Budenheim Utz 64A
Mechanical treatment of tricalcic ——. (P) Comp. des Phosphates de Constantine 794A
Microchemical two-phase reaction for detection of —— as magnesium ammonium phosphate. Kunz-Krause 767A
Mixtures of bicarbonate, free carbonic acid, and primary —— as buffer systems in place of mixtures of primary and secondary phosphate. Windisch and Dietrich 293A
Rate of solution in water containing carbon dioxide of phosphoric acid of —— Maschhaupt 75A
Sensitive colour test for ——. Denigès 781A
Supply of rock —— 58R
Utilisation of iron-aluminium ——. Stanley 344A
Phosphatides, Preparation of —— from coloured plant organs Fritsch 800A
Phosphine; Oxidising —— (P) Davis 109A
Phosphomolybdic acids. Wu 655A
Phosphorescence of zinc sulphide, Influence of crystalline form, flux, and aqueous fusion on ——. Tiede and Schleede 747A
Phosphoric acid, Compound of glycol and —— Fischer and Pfahler 700A
Compound of starch with —— Kerb 700A
Conductometric titration of —— Kolthoff 735A
Determination of —— Kleinmann and Feigl .. 707A
Determination of —— as ammonium phosphomolybdate Stutzer 250A
Determination of —— in phosphates of heavy metals. Seeligmann 626A
Determination of small amounts of —— as barium phosphomolybdate in presence and in absence of organic phosphorus compounds. Posternak .. 585A
Gibbs's volumetric method for determination of ——. Tuinzing 85A
Manufacture of oils and fats containing ——. (P) Chem Fabr M'örsheim Noerdlinger 72A
Manufacture of —— from phosphate rock in a fuel-fed furnace. Waggaman and Turley 595A
Manufacture of phosphorus and ——. (P) Waggaman 384A
Qualitative analysis in presence of ——. Remy .. 208A
Removal of —— from hydrofluoric acid. (P) Ross . 231A
from superphosphate manufacture; Utilisation of —— in saccharification of cellulose. (P) Schmidt, and Chem. Fabr. Rhenania 309A
Volumetric determination of ——. Iversen 707A
Phosphorus; Action of ——, during oxidation, on the photographic plate, and its ionising power. Jorissen 528A

— Thalleioquin reaction for ——. Hart 432R
Quinine salts; Detection of other alkaloids in ——. Kolthoff 312A
Quinizarin; Oxidative formation of 1.4.1'.4'-tetrahydroxy-2.2'-dianthraquinonyl from ——. Scholl and others 152A
Quinol; Manufacture of ——. (P) Kitchen, and K. and T Chemical Corp. 100A
Reactions of —— Messner 638A
Quinoline bases, Modification of Skraup's synthesis for preparing —— and their conversion into stannichlorides Druce 40A
synthesis; Modification of Skraup's ——. Barnett . 763A
Quinoline dyestuffs:
Carbocyanines as photographic sensitisers Mills and Pope 802A
Cyanine dyestuffs Mills and Evans 695A
Cyanine dyes for use as photographic sensitisers Barbier 528A
Isocyanine dyes; Manufacture of photographic sensitising —— (P) Wise and Adams .. 502A
Isocyanine dyes, Manufacture of photo sensitising — effective for infra-red radiation (P) Adams and Wise 502A
Isocyanine dyestuffs as photographic sensitisers Mills and Pope 468A
Isocyanines, Constitution of —— Mills and Wishart 540A
Quinone dyestuffs, Manufacture of — (P) Becke and others 10A
Quinone, Manufacture of ——
(P) Kitchen, and K. and T Chemical Corp . 100A
(P) Weiss and others . 9A
Quinone-imide dyes
Cyanoacridine dyes, Absorption spectra of some — — Kehrmann and Sandoz 224A
Cyanopyronine dyes, Absorption spectra of some — — Kehrmann and Sandoz 224A
Quinones; Action of *o*-aminothiophenol on ortho- ——. Stahrfoss 225A

R

Rabbits. (P) Sayre 256A
Radioactive compositions, Use of —— in growing plants (P) Ullier 759A
materials and objects, Manufacture of luminous (P) Parade and others 702A
Radioactivity of uranium Staehling 62A
Radium-barium salts, Crystallisation of — — Scholl 486A
compounds, Manufacture of —— (P) Hedstrom 156A, 449A, 658A*, 700A*
Concentration of —— by fractional crystallisation Norman 446A
emanation, Colouring and thermoluminescence of glass produced by Lind 625A
Microchemical reactions of — — and its differentiation from barium by iodic acid Denigès 748A
Practical methods for determination of —— Alpha-ray and gamma-ray methods Lind .. 539A
Production of gold and —— by decomposition of mercury. (P) Perez 435A
radiation, Action of — on sucrose and agar Fernau 554A
Supplies of —— 209R
-toxin; Manufacture of — (P) Merck 765A
Raffinose; Determination of sucrose in presence of invert sugar and —— Montgomery 759A
Hydrolysis of — — Hilkt 635A
Rail conveyance of chemical commodities
Archbutt .. 571R
Bullock .. 341R
Lukes .. 315R, 342R, 426R
Railway rates, ... 348R
Raising acids by the Kestner patent automatic elevator Beavell 142T
and forcing apparatus for solids and semi solids; Fluid and/or air direct pressure — —. (P) Adams and Adams 144A, 500A*
liquids by direct fluid pressure, Apparatus for — —. (P) Ogden 92A
water or other fluids by compressed air, through special reversing valve, automatically operated (P) Norman 437A*
water and other liquids; Means for — — (P) Swainson 255A
Rape; Proximate composition of Korean —— Ueda 541A
Ramose nuts; Fermented liquor from —— (P) McKee .. 130A
Ramsay Memorial Fund 14R
Rancidity test; Preparation of phloroglucinol reagent for the Kreis ——. Dixon 341A
Rare earths. *See under* Earths.
Raschig rings; Use of — in the acid industry. Schellhaase 265A
Rat poisons; Research in connexion with —— 101R

PAGE

Reaction and like columns. (P) Gay 537A
towers; Filling material for ——:
(P) Prym und Co. 321A, 435A
(P) Zieren 356A
Reactions; Apparatus for conducting high-temperature ——. (P) Testrup, and Techno-Chemical Laboratories, Ltd. 54A*
between gases; Apparatus for bringing about and controlling ——. (P) Conover 93A
between liquids, gases, or liquids and gases; Electrical treatment of reagents for chemical ——. (P) Wielgolaski 162A
Carrying out chemical —— by catalysis. (P) Soc Chim Usines du Rhône 589A
Method and apparatus for carrying out certain chemical —— (P) Hughes 144A
started by a primer Berger 542A
in the vapour phase; Producing catalytic ——. (P) Canon, and Barrett Co. 740A
Reagents, Preparation of organic chemical — —
Adams and Marvel 279A
Kamm and Marvel 279A
Supply of organic — — in U.S.A. 397R
Rectification apparatus Masfaraud 303T
apparatus, Cooling plate for continuous ——. (P) Barbet 179A*
apparatus, Distilling and —— (P) Hübner .. 640A
column; Glass —— for rectification of liquid mixtures and recovery of volatile solvents Elsner . 175A
columns; Hood exits for ——. (P) Frischer .. 774A
and distillation Gay 287A, 701A
and like columns (P) Gay 537A
Rectifiers and condensers (P) Beyer and others . 712A
Recuperators, Heat — — (P) Trinks, and Tate-Jones and Co, Inc 507A
Red pea gall; Colouring matter of —— Nierenstein . 101A
Redo, Evaluation of — Bruhns 402A
Reduction of aromatic nitro compounds by means of platinum and hydrogen Cusmano 328A
of gases (P) Koehler 225A
of metallic oxides
(P) Bourcoud 575A
(P) Morrison 694A
methods, New volumetric — with arsenious anhydride. De Bacho 240A
of minerals and other pulverulent materials. Apparatus for — —. (P) Rôel 773A
of ores, metal oxides, and the like (P) Kohle und Erz Ges 661A
of organic compounds. Electrolytic — — (P) Bayer und Co 458A
Reeds, Obtaining technically valuable products from —— (P) Verwertung inländischer Produkte Ges 165A
Treating — to obtain fibrous material and a by product (P) Hoering .. 565A
Utilisation of — Heuser 744A
Reflectors; Manufacture of metallic — — (P) Cowper-Coles 825A
Refraction, Significance of specific — in analytical chemistry Schoorl 544A
Refractometer, Analysis of aqueous solutions with the aid of the De Crinis 766A
Use of — — in ascertaining purity of refined edible oils. Trim 707T
Use of immersion — — for determining concentration of aqueous and alcoholic solutions Wagner 836A
Use of Zeiss immersion — for thin layers Dietsche and Grave 503A
Refractories Behaviour of aluminous under load Bleininger 468A
for coke ovens Rees 217A
Electrical resistivity of — at high temperatures. Hartmann and others .. 660A
for glassworks' use, Specifications for — — Rees 233A
in iron and steel industries Nesbitt and Bell 111A
Magnesia — McDowell and Howe .. 490A
Mullite process for production of sillimanite — — Wallnoyzsky 665A
Manufacturers' Association, Work of technical division of Howe 111A
Physical properties of specialised — — Hartmann and Hongen 365A
Hartmann and Kolder 365A
Possible explanation of failure under load at high temperatures of fireclay — — Watts 598A
Preservation of glass-furnace — — by water-cooling Christmas 60R
selection of — — for industrial furnaces Rochow 111A
superior — Purdy 111A
for zinc furnaces. Audley 237A
Refractory articles, Manufacture of — — —
(P) Carborundum Co. 409A*
(P) Linbarger, and Carborundum Co .. 820A
bodies, Manufacture of solid — — from nitrides. (P) Podszus, and Chemical Foundation, Inc. 450A*
bricks; Light-weight ——. (P) Purdy and others .. 599A
bricks; Metal-encased magnesia —— 39R
cements:
(P) Booth, and Ramsay and Son Co. .. 20A

Resinates; Molten metallic ——. Nicolardot and Coffignier 211A

Resinous bases; Obtaining —— from tar. (P) Wirth, and Chemical Foundation, Inc. 815A*
compositions, Manufacture of potentially-reactive —— (P) Baekeland, and General Bakelite Co. 728A
condensation products; Manufacture of ——. (P) Dunham 164A, 342A*
condensation products, Manufacture of —— from phenols and formaldehyde. (P) Chem Fabr Albert and Berend 122A, 273A
material; Manufacture of —— from wood tar. (P) Riedel A.-G. 633A
moulded products, Manufacture of ——. (P) Richardson, and Cutler-Hammer Mfg Co 522A
products; Manufacture of —— from high-boiling coal-tar distillates. (P) Bailey and others 713A
substances, Separation of low-boiling constituents of ——. (P) Chem Fabr Worms A.-G. 398A
substances of vegetable origin suitable for impregnating substitutes for textile fibres, Manufacture of —— (P) Fuchs 241A

Resins from Cochin China; Characteristics of some —— Nicolardot and Coffignier 198A
Converting —— into dry powders. (P) Marcus 802A
Coumarone —— and formolites Rapp 273A
coumarone-; Insulating material from ——. (P) Wells, and Ellis-Foster Co 340A
coumarone-; Manufacture of —— soluble in alcohol (P) Rütgerswerke A.-G. 507A
coumarone-, Manufacture of varnish from unsaponifiable —— without the use of benzol as solvent (P) Schwarz 728A
coumarone-; Suitability of low-temperature coal tar for production of ——. Gluud and Breuer 262A
Determination of saponification value of dark ——. Salvaterra 72A
Extraction of —— (P) Bollmann 577A
Extraction of gum —— from grass trees (P) Pooley and Strevens 697A
Formation of —— by action of dilute alkalis on acetaldehyde Hammarsten 764A
Hardening synthetic —— (P) Jackson, and Westinghouse Electric and Manufacturing Co 73A
or the like, Production of synthetic ——. (P) Robinson-Binnley and others 75A
Manufacture of ——
(P) Koppers Co., and Darrin 757A*
(P) Ver Chem Werke and others 273A
Manufacture of artificial ——
(P) Böhler 377A
(P) Copthorne and Tannehill 757A
(P) Darrin, and Koppers Co 165A
manufacture of artificial —— by action of furfural on phenols. Beckmann and Behn 577A
Manufacture of artificial —— from wood tar. (P) Hamburger 792A
from manufacture of benzene, Manufacture of pale, readily-drying oils from acid ——. (P) Schümmer 613A
Obtaining —— from wood. (P) Aktiebolaget Cellulosa 307A
oleo-; Production of —— in India 379R
Paracoumarone —— 288R
paracoumarone-; Use of —— in varnishes King and others 551A
Purification of —— (P) Brooks, and Commercial Research Co. 522A
Recovery of turpentine and —— from resinous woods. (P) Sawyer 377A
Solvent for extraction of ——. (P) Tetralin Ges 665A
synthetic; Solvent media and their effect on varnishes made with ——. Wolff 342A
from *Xanthorrhœa* species. Rennie and others 459A

Resorcinol; Fusion of sodium benzene-*m*-disulphonate with sodium hydroxide for production of —— Phillips and Gibbs 685A

Retene and its derivatives; Preparation of aromatic nitrocompounds from —— (P) Arpot 701A
Relationship of —— to resin acids, and hydrogenated retenes. Virtanen 792A

Retorts, Ovens for distillation of fuels and bituminous ores. (P) Hasser 327A

Retorts. (P) Prentice 2A
for cracking hydrocarbons; Means for removing carbon from ——. (P) Kittman and Dutton 221A
for distillation of carbonaceous materials; Heating of vertical ——. (P) Wild and others 813A
Distillation —— and separating tank. (P) Rendall, and Carbon Products Co. 500A

Industry, Position and prospects of the —— Williams 268B
Industry Progress in —— in 1919 Twiss .. 32B
industry and the war Perritt 195B
latex, Bacteriological study of coagulation of Hevea —— Denier and Vernet 698A
latex, Coagulation of (P) Nixon-Westwood .. 552A
latex, Coagulation of —— with calcium saccharate Stevens 826A
Latex and —— from individual trees De Vries .. 665A
-latex; Investigations on different coagulants for —— De Vries 665A
latex, Natural coagulation of Hevea —— in absence of air Spoon 73A
latex, Natural coagulation of Hevea —— in absence of air after addition of calcium salts Spoon .. 665A
latex, Spontaneous coagulation of —— De Vries and Spoon 665A
latex; Synthetic acetic acid as coagulant of —— Stevens 199A
latex; Treatment of —— (P) Slocum, and General Rubber Co 343A
latex; Viscosity of —— and its bearing on rate of cure Stevens 826A
-like masses, Manufacture of plastic (P) Ribot 342A
-like masses, Manufacture of soft and hard (P) Traun's Forschungs-laboratorium 241A
-like masses, Manufacture of —— from yeast and formaldehyde. (P) Blücher and Krause .. 242A
or like substances Synthetic production of —— (P) Gottschalk 122A
Machine for kneading or mixing (P) Banbury 507A*
Machine for testing elasticity of soft vulcanised Schob 605A
Manufacture of —— (P) Barton and others .. 165A*
Manufacture of vulcanised —— (P) Barton, and Titanium Alloy Manufacturing Co 124A
manufactures; Foreign competition in —— .. 204B
Maturation of —— Stevens 826A
membrane; Process of diffusion through a Daynes 552A
Methods of preparation of plantation —— 728A
micro-fungus, Scott 633A
mixings; Determination of carbonates in —— Pearson 82A
mixings; Grinding machines for sawdust to be used in ——. (P) Marshall 35A
from natural coagulum (slab), Uniformity of ——. Stevens 198A
obtained by coagulation of latex, Resistance of ——. Henri 273A
output; Limitation of —— 384B

Rubber—*continued* PAGE

packing; Heat-resisting ——. (P) Stromeyer .. 274A
Permeability of —— to gases Edwards and Pickering 578A
Preservation of vulcanised ——. Stevens 251T
Prizes for suggestions for extension of uses of —— .. 203B
production and prices 239B
Reactions of accelerators during vulcanisation of ——. Bedford and Scott 199A
reclaimed, Manufacture of waterproof material using ——. (P) Fränkel und Runge, and Golombek .. 698A*
Reclaiming ——
(P) Bedford, and Goodyear Tire and Rubber Co 35A*
(P) Kryder 496A
(P) Twiss, and Dunlop Rubber Co 378A*
(P) Van Raap 307A
(P) Young and others 165A
Reclaiming cotton and —— from waste (P) Young, and Acushnet Process Co 35A
Recovering plastic —— from fabrics (P) Furness, and Acushnet Process Co 35A
Regeneration of —— from old rubber and scrap (P) North and Loosli 35A
and rubber-like materials; Reclaiming —— from fabrics coated therewith (P) Acushnet Process Co 578A*
seed oil, Para —— *See under* Oils, Fatty
situation in Indo-China 291B
stress-strain curve, "Slope" or "type" of the —— De Vries 308T
substitute, Manufacture of ——. (P) Gregory, and Western Rubber Co 35A*
Synthetic —— Stevens 198A
synthetic, Future of —— 274B
synthetic, Production of highly elastic vulcanisates from —— (P) Mitteldeutsche Gummiwarenfabr. Peter 165A
Testing device for determining "viscosity" of ——. (P) Naylor, and Fisk Rubber Co. 199A
trade of Brazil 348B
trade in Italy 227B
trade of Japan 245B
trade in Norway 312B
Treatment of raw ——. (P) Dunlop Rubber Co, and others 698A
Treatment of raw —— freshly coagulated from latex. (P) Davidson 757A
trees, Utilisation of bark shavings from ——. (P) Claessen 827A*
Utilisation of bark shavings from rubber trees, and extraction of —— from such shavings (P) Claessen 495A
Variations in fine hard Para and plantation —— Stevens 826A
Vulcanisation of ——
(P) Gibbons, and American Rubber Co .. 666A
(P) Meyer, and Morgan and Wright .. 666A
(P) Molony, and Michigan Chemical Co .. 552A
(P) Ostromislensky, and New York Belting and Packing Co 552A
Peachey and Skipsey .. 376B
Vulcanisation and depolymerisation of —— Seidl .. 522A
waste, Apparatus for reclaiming ——. (P) Kryder and Snyder 495A

Silicon carbide; Manufacture of ——
Brockbank 42T
(P) Hutchins, and Carborundum Co 297A
carbide; Manufacture of shaped objects of —— (P) Gebr. Siemens und Co 491A
compounds; Optically active ——. Kipping .. 129R
halides; Manufacture of fluid —— (P) General Electric Co. 448A, 658A*
hydrides. Stock and Somieski 62A
tetrachloride. Manufacture of ——. (P) General Electric Co. 658A*
Silk, artificial; Apparatus used in manufacture of ——. (P) Clayton 153A*, 293A*, 719A*
artificial; Dyeing of ——. Wilson and Imison .. 322T
artificial; Exports of —— from Switzerland 209R
artificial; Manufacture of ——.
Briggs 286R
Wilson 286R, 307R
(P) Stuiksseyer 444A
artificial; Manufacture of —— in France 132R
artificial; Manufacture of —— for industrial textile purposes. (P) Deutsche Gasglühlicht A.-G. .. 596A
artificial; Manufacture of —— in Italy 322R
artificial; Manufacture of —— in Poland 322R
artificial; Manufacture of —— in U.S.A. 271R
artificial; Precipitation and purification of solutions of ——. (P) Talmasey 778A
artificial; Proteids derived from vegetable proteins for manufacture of ——. (P) Ostenberg 283A
artificial; Production of —— in Belgium 257R

Silk—*continued.*
artificial; Tensile strength of ——. Krais 329A
artificial; Treatment of ——. (P) Lauffe 686A
Biuret reaction of ——. Battegay and Voltz .. 568A
Colouring of —— with strong acids. Waentig .. 10A
Delumming of —— 218R
Degumming —— by treatment with water under pressure. (P) Bayer und Co. 13A
Dyeing raw ——. (P) Maupai 514A, 687A
fabrics; Machines for finishing ——. (P) Vuono .. 687A*
Increasing the strength and elasticity and preventing or decreasing the subsequent weakening of fibres of loaded ——. (P) Korselt 186A
industry; Research association for the —— 230R
Loading ——. (P) Deutsche Gasglühlicht A.-G. 17A, 779A
Manufacture of ——. (P) Korselt 482A
Process for black dyeing and loading of —— (P) Ullnerwerk Ges. 401A
Prolonged action of a moderate heat on spun ——. Knecht 540A
Relation between internal complex metallic salts and solubility of —— in ammoniacal nickel solutions. Battegay and Voltz 568A
tussar; Black dyeing of ——. Srivastava 514A
-wood textiles, Reducing the permeability of ——. Colombo 816A
Silliamanite; Preparation of fused artificial ——. Malinovszky 180R
refractories; Mallinite process for production of —— Malinovszky 365A
Silver; Bactericidal action of ——. Doerr 702A
coinage; Reduction of fineness of —— 70R
Electrodeposition of —— from cyanide solutions. Christy 337A
foil; Production of transparent or opaque enamels on wrought iron (sheet iron) by means of layers of —— (P) Fix und Schmidt 491A
-gold alloys, Action of *aqua regia* on —— in presence of ammonium salts. Pollard 299A
Growth phenomena of —— Beutell .. 269A
-manganese alloys Siebe 27A
Microchemical detection of ——
Bayer 721A
Emich 721A
New methods in hydrometallurgy of —— Freeman 9R
ore, Discovery of —— in Spain 114R
Recovering —— from photographic films (P) Horton 676A
Recovery of lead and —— from sulphide ores and metallurgical products (P) Amalgamated Zinc (De Bavay's) Ltd., and Gandin 117A
refining slags and residues, Complete analysis of ——. Stahl 660A
Silver compounds; Reducing the light-sensitiveness of ——. (P) Sulzberger 834A
nitrate, Penetration of sodium chloride into agar-agar gels containing —— Stiles 274A
-protein preparations. Manufacture of stable — readily soluble in water (P) Bayer und Co .. 765A
salts of aliphatic α-amino-acids, Manufacture of complex —— (P) Napp 640A
salts, Manufacture of therapeutic agents containing —— (P) Sächsisches Serumwerk und Institut für Bakteriotherapie 427A
-salvarsan Binz and others 348A
Sintering concentrates, Apparatus for —— (P) Ekglund 118A
Size, Manufacture of —— from horny material. (P) Schmidt 698A
for paper; Manufacture of —— (P) Mitscherlich .. 264A
Sizing paper cardboard, textile fabrics, etc., by means of sulphite-cellulose waste liquor. (P) Raach .. 745A
paper fabrics, etc. with glue, casein, etc. (P) Exportingenieure für Papier- u. Zellstofftechnik .. 513A
paper, fabrics, and the like (P) Schmidt and Hesser 15A
paper and the like (P) Feldmühle Papier und Zellstoffwerke A.-G. 15A
paper and other absorbent materials. (P) Holzverkohlungs-Ind. A.-G. 60A
textile fabrics (P) Poulson 779A
yarn in hank form; Machines for —— (P) Lord and Lord 186A, 625A*
Skin-like compounds; Forming shaped articles from precipitated ——. (P) Swett, and Little, Inc. .. 634A
Skins, Degreasing —— preparatory to tanning. (P) Krause 407A
Impregnation of —— with liquids under vacuum (P) Quas-Cohen and others 514A
Liming and other tanning operations upon —— (P) Owens 522A*
Machine for treating —— (P) Merrier 634A*
Tanning and liming of ——. (P) Dufour and Dufour 165A
See also Hides and Pelts
Slag, basic; Obtaining —— with high phosphorus content. (P) Queling 493A
basic; Prices of —— 118R
basic; Rate of solution in water containing carbon dioxide of phosphoric acid of ——, Maschhoupt 75A
basic; Solubility in citric acid of phosphates in ——, Kaymer 702A
blast-furnace; Classification of cements made from ——. Lewis 409A
blast-furnace; Disintegration of ——. Endell .. 297A

Determining the permeability and heat-insulating value of —— Colombo 816A
Device for treating ——. (P) Dudley 361A
Dressing, printing, and dyeing ——. (P) Günther .. 445A
Impregnation of —— with liquids under vacuum. (P) Quas-Cohen and others 514A
Rendering —— water-repellent (P) Bayer and Co. .. 59A
Testing relative resistance of ——. Levine and Veitch 292A
treated with Turkey-red oil or the like; Preventing —— acquiring a yellow tint. (P) Boehringer Sohn .. 817A
Washing —— (P) Elkan Erben Ges. 293A
Thalleioquin reaction for quinine. Hart 432R
Thallic compounds, Detection of —— by means of diphenyl derivatives. Feigl 706A
Thallium compounds, Use of —— in organic chemistry. Freudenberg and Uthemann 82A
Theobromine; Determination of ——. Wadsworth .. 414A
Solubilities of ——. Wadsworth 92R, 383A
Thermal analysis. *See under* Analysis.
conductivity of solid insulators. Thornton 31
conductivity; Variation of —— during fusion of metals. Konno 268A
expansion; Stretched wire apparatus for measuring ——. Gray 137A
operations, Apparatus for conducting a liquid and a gas soluble in the liquid through a closed cycle of (P) Beadle 821
Thermo-couple; Base-metal ——. (P) Hereus Ges. .. 86
installation in annealing kilns for optical glass Williamson and Roberts 116
Thermo-couples; Chromium-nickel alloys for ——. (P) Heraeus 311
Construction of —— by electro-deposition. Wilson and Epps 70
for low-temperature work; Needle type —— Taylor 97
Potentiometers for use with —— White 13
Thermodynamics; Applications of chemical ——. Urbain 65
Thermo-electricity; Recent progress in ——. Benedicks .. 19

Thermo-elements; Protective covering for ——. (P) Siemens and Halske A.-G. 769A
Thermometer; Differential air —— and recording gas calorimeters. Nadsen and Herber 612A
Electrical resistance ——. (P) Heraeus 312A
Therw>-regulator for air-ovens. Atkinson 298r
Thienylquinolinecarboxylic acids. (P) Soc. Chem. Ind. in Basle 704A
Thiocarbonyl tetrachloride; Preparation of ——. Frankland and others 164A, 256r
Preparation of thiophosgene from ——. Frankland and others 313r
Thiocyanates; Determination of —— in ammoniacal liquor and waste liquor from ammonia recovery stills. Shaw 564A
Volumetric determination of —— with permanganate. Mourice 687A
Thiocyanogen; Free ——. Söderbäck 189A
Thionaphthene in coal tar. Weissgerber and Kruber .. 716A
Separating —— from coal tar. (P) Ges. für Teerverwertung 777A
Thionate solutions containing sulphite and bisulphite; Conversion of —— into pure thionate solution. (P) Feld 191A
Thiophen; Estimation of —— in commercial benzol. Meyer 151A
Thiophor dyestuffs. *See under* Sulphur dyestuffs.
Thiophosgene; Preparation of —— from thiocarbonyl tetrachloride. Frankland and others 313r
Thiosulphates; Manufacture of alkali ——. (P) Clemm .. 406A
Volumetric determination of hydrosulphides in presence of sulphides, sulphites, and ——. Wöber .. 625A
Thiourea; Formation of —— by interaction of carbon bisulphide and ammonium carbonate. Gilfillan .. 801A
Thorium; Recovery of ——. (P) Berndt, and Lindsay Light Co. 232A
(P) Ryan, and Lindsay Light Co. 669A
Recovery of —— as pyrophosphate. (P) Golts .. 23A*
Separating —— from other rare earths. (P) Clarke .. 450A*
Separation of —— from other metals of the rare earths. (P) Dietsche, and Chemical Foundation, Inc. .. 364A
-oxide; Manufacture of ——. (P) Merck 765A
Thorium compounds; Manufacture of ——. (P) Lindsay Light Co. 750A*
compounds; Recovery of —— from monazite sands. (P) Berndt, and Lindsay Light Co. 517A
nitrate and other thorium salts; Manufacture of ——. (P) Clarke 450A*
Thread; Manufacture of —— from paper or like material (P) Grant 153A*
Production of sewing or basting —— from paper. (P) Vohwinkler Papier- u. Salicyl-Pergamentpapier-Ind. 226A
Threads; Bath for spinning —— from viscose. (P) Hartogs 778A
Thymol; Synthesis of —— from p-cymene. Phillips and Gibbs 639A
Synthetic manufacture of ——. (P) Phillips .. 528A
hyroxin; Chemical identification of ——. Kendall and Osterberg 133A
Idal energy; Proposed utilisation of —— in France .. 357R
lles and the like; Plant for manufacture of ——. (P) Atkins and Colquhoun 599A*
Ovens or kilns for manufacture of ——. (P) Marlow .. 112A
Timber; Laboratory tests on value of preservatives for ——. Falck 171A
Legal decision in regard to Powell process for treatment of —— 12R
See also Lumber and Wood.
Tin; Alloy suitable as substitute for —— (P) Zimmer .. 30A
or its alloys; Coating metallic surfaces with ——. (P) Berlin-Anhalter Maschinenbau A.-G. 303A
alloys; Electrolytic refining of ——. (P) Siemens und Halske 493A
Coating sheet metal with —— on one side only. (P) Fowlands 30A*
coatings; Determination of arsenic in ——. Vallery 158A
Determination of arsenic in ——. Vallery .. 158A
Determination of —— by cupferron. Kling and Lassieur 670A
Electrolytic estimation of —— in tetrachloride. Baxter and Starkweather 492A
Electrolytic refining of ——. Kern 722A
Export duties on —— 224R
in India 358R
Staining test for detection of ——. Feigl 189A
Influence of —— on structure and properties of naval brass. Campbell 699A
-lead-antimony alloys. Guertler 411A
Manufacture of alloys of lead, copper, zinc, and —— (P) Vereinigte Metallwerke Durbach-Ebb-Döbelner A.-G. 161A
Manufacture of —— from iron free from tinplate scrap and the like. (P) Chem. Fabr. Buckau, and Silbermann 70A
mining industry, Position of Cornish —— 240R
ore; Dressing of —— in South Africa 238R
ores; Treatment of tungsten, bismuth, and —— Hitchcock and Pound 198A
Oxidation of ——. (P) Macconochie and De Roo .. 445A
-phosphorus alloys. Vivian 110A, 679A
-plate industry in Japan 423R
-plate and other metal-coated plates or sheets; Apparatus for use in manufacture of ——. (P) Thomas and Davies 662A*
-plate; Recovering tin from waste ——. (P) Ekhund .. 303A
-plate scrap; Detinning ——. (P) Chem. Fabr. Buckau 303A
-plate scrap; Manufacture of tin free from iron, from ——. (P) Chem. Fabr. Buckau, and Silbermann .. 70A
-plate; Use of hydrogenated oils in manufacture of ——. Collins and Clarke 265A
plating from alkaline tin baths by use of addition agents. Mathers and Bell 302A
Precipitation of —— by iron: Bouman 569A
Kolthoff 747A
production in Federated Malay States 154R
production in South Africa 94R
Recovering —— from waste tin plate or the like. (P) Ekhund 303A
Recovery of —— from solutions. (P) Rumbold .. 68A
Revision of atomic weight of ——. Baxter and Starkweather 492A
scruff produced in making tin and terne plates; Treatment of ——. (P) Clegg 753A
Separation of antimony and ——. Kling and Lassieur 670A
Solubility in the solid state of —— in lead. Parravano and Scorteccl 412A
Volumetric determination of ——. Druce 735A
Tin oxide; Manufacture of ——. (P) Maconochie and De Roo 446A
oxide; Substitutes for —— in glazes. Minton 366A
salts; Reaction of ——. Masuir 282A
Tinning aluminium. (P) Page and Rubin 823A
aluminium and its alloys. (P) Stabilimenti "Blak" Pouchain 29A, 339A*
Furnaces for —— (P) Harper, Sons, and Bean, Ltd., and Conroy 681A*
Titanic acid; Solubility of gels of —— and of niobic and tantalic acids in mixtures of hydrogen peroxide and acid. Hahn and Gille 819A
Titanic oxide; Manufacture of ——. (P) Barton, and Titanium Alloy Manufacturing Co. 657A
oxide pigments; Manufacture of ——. (P) Nielsen and others 552A
Titaniferous iron ore; Treatment of ——. (P) Van der Toorn, and Industrie & Mijnbouw Maatschappij "Titan" 371A
iron ore; Utilisation of —— in New Zealand. Hesketh 451A
ores; Direct production of refined iron and steel from —— (P) Loke and Loke 196A*
Titanium alloys, Electrical properties of ——. Hunter and Bacon 411A
-chromium-iron alloys, Manufacture of ——. (P) Sicard, and U.S. Ferro-Alloys Corp. 724A
Determination of iron and —— in rocks. Ferrari .. 237A
Determination of —— in steel. Lundell and Knowles .. 574A
Distribution of —— in soils and plants. Gelfmann .. 667A
Hardening iron by means of a mixture containing ——. (P) Eichler 575A
Separation of iron, aluminium, chromium, glucinum, zirconium, and —— by means of sodium carbonate. Wenger and Wuhrmann 46A
Separation of zirconium and —— as phosphates. Brown and Madden 316A
-zirconium-iron alloys; Manufacture of ——. (P) Sicard, and U.S. Ferro-Alloys Corp. 415A
Titanium chloride; Estimation of carbonyl chloride in ——. Delépine and Lafore 403A
compounds; Extraction of —— from titaniferous material. (P) Jebsen, and Titan Co. A./S. .. 334A
compounds; Manufacture of —— (P) Farup, and Titan Co. A./S. 545A*
(P) Goldschmidt, and Titan Co. A./S. .. 633A
(P) Wrigley and others 450A*
compounds; Manufacture of —— from precipitated titanium hydroxides. (P) Nielsen and others .. 552A
compounds; Pigments containing ——. (P) Goldschmidt, and Titan Co. A./S. 552A
compounds; Recovering vanadium and/or —— from minerals containing them together with iron. (P) Kjellgren 783A
halides; Manufacture of solid ——. (P) General Electric Co. 448A
oxide in enamels. Landrum and Frost 546A
oxide; Use of —— in cements 271R
-oxygen compounds; Manufacture of ——. (P) Farup, and Titan Co. A./S. 517A
-oxygen compounds; Manufacture of hydrated ——. (P) Farup, and Titan Co. A./S. 405A
salts; Preparation of solutions of iron salts and ——. (P) Claus and others 335A*
Titration curves; Colorimetric determination of ——. Gillespie 830A
in acetic liquors 278A
in resins and determination of acidity of resins. Alner 660A

Distribution of certain chemical characters of —— over its proximate constituents Dore 513A
Dry distillation or drying of —— (P) Aktiebolaget Cellulosa, and Magnuson 359A
Effect of viscosity on penetration of creosote into ——. Bateman 336A
Effectiveness of sodium fluoride used as an antiseptic for preservation of ——. Devaux and Bouygues .. 409A
Extraction of —— with dry and moist benzene under pressure. Fischer and Kleinstück 218A
Fireproofing —— 379R
Fireproofing —— (P) Weiss, and Burgess Laboratories 491A, 590A
Hardening, fireproofing, and preserving permeable soft —. (P) Lambert 336A, 599A*
Inaccuracy of treatment tests of impregnated —— Bateman 193A
Manufacture of alcohol from ——. (P) Moore, and Brown Co 130A
Manufacture of fodder from ——. (P) Mühlenbein .. 346A
Manufacture of textile fibres from —— (P) Enge .. 444A
Preserving —— (P) Grubenholzimprägnierung Ges. 13A
(P) Röping 573A
Preserving and fireproofing —— (P) De Vecchis .. 750A
Procuring and securing products from —— (P) Reid, and International Nitrogen Co 735A
Protecting and fireproofing —. (P) Arentox Co .. 547A*
Proximate analysis of coniferous —— Dore 513A
pulp digester liquor, Recovering valuable constituents from —— (P) Moore and Brown Co 153A
pulp industry in Sweden in 1919 .. .. 275R
pulp and the like; Apparatus for extracting water from —— (P) Wagner, and Aktiebolaget Karlstads Mekaniska Verkstad 624A*
pulp liquor; Re-acidification of raw —— (P) Grätz 660A
pulp liquor; Refining crude —— (P) Hein, and Chemical Foundation, Inc. 568A
pulp manufacture; Removing water from pulp sheet in —— Wagner, and Aktiebolaget Karlstads Mekaniska Verkstad 624A*
pulp manufacture; Utilisation of spent liquors from ——. Miller 330A
pulp; Nitrocellulose from —. Woodbridge, jun .. 386A
pulp; Reclaiming waste products in manufacture of ——. (P) Moore and others 227A
pulp; Recovery process in manufacture of sulphate —— (P) Olsson 60A
pulp; Straining apparatus for use in manufacture of ——. (P) Martin, and Lloyd, Ltd 595A*
Purifying resin-soap produced by heating comminuted —— with sodium carbonate. (P) Lange 241A
Recovering oils through destructive distillation of —— (P) Hänsen, and Pine Nene Products Co. 261A
Recovery of by-products formed by destructive distillation of —— in suction gas plants. Roberts 776A
Recovery of organic products from ——. (P) Weiss, and Burgess Laboratories 492A
Regularities in preservation of ——. Poisoning action of inorganic salts on fungi. Moll 799A
Rendering —— impermeable and recovering liquids contained therein. (P) Roy 490A*, 451A

Wood—*continued.*
Saccharification of —— by means of sulphuric acid: (P) Zellstoff-fabr. Waldhof, and Clemm .. 203A
(P) Zellstoff-fabr. Waldhof, and Hottenroth .. 204A
Salt mixtures as preservatives for —— against fungus and decay. Moll 236A
Staples composite ——. (P) Fish, jun. 236A
spirit; Continuous rectification of ——. Masfarand .. 304T
stain; Manufacture of a substance suitable for producing a durable ——. (P) Fuchs 826A
Sterilised ——. (P) Fish, jun. 236A
-tar. *See under* Tar.
Textile fibre from ——. (P) Mutter 102A
Treating and drying ——. (P) Fish, jun 236A
Treatment of —— by boiling or steaming with reagents. (P) Hauss 226A
waste and like substances; Manufacture of a building material from ——. (P) Gallinowsky and Visard 519A
or woody fibre; Destructive distillation of ——. (P) Poore 814A
See also Lumber *and* Timber.
Wooden vessels; Coating —— with bakelite. (P) Arnstädter Maizfabr. Windesheim, and ten Doornkaat-Koolman 53A
Woods; Distillation of South Indian ——. Watson and others 327A
Proximate analysis of hard ——. Analysis of *Quercus agrifolia* Dore 778A
Woody fibre; Distillation of —. (P) Poore 396A
fibres; Digestion of —— with chlorine for production of cellulose and textile fibres Waentig and Gierisch 817A
Wool; Absorption and retention of soap by ——. Woodmansey 10A
Action of atmospheric influences on —— Gram 481A
Xerteaz 481A
Analysis of mixtures of vegetable fibres and ——. Krais and Blitz 512A
Apparatus for drying —— (P) Wilson 482A
Apparatus for scouring, dyeing, or otherwise treating with liquor —. (P) Walker 720A*
artificial; Production of durable fabrics of —— (P) Becke 444A
Biuret reaction of —— Battegay and Voltz 568A
Cause of so-called "Allworden's reaction" of ——. Krais and Waentig 329A
Cleaning —. (P) McBride, and U S Wool Co. .. 59A
Colouring —— with strong acids Waentig 10A
and cotton fabrics; Analysis of mixed —— Duyk .. 816A
Effect of atmospheric action on —— Wagner .. 512A
fabrics, Production of durable —— (P) Becke .. 444A
fat; The "oily acid" of —— Lifschütz 697A
fat; Saponifying —— (P) Lifschütz 790A
fibre, Influence of humidity upon strength and elasticity of —— Hardy 481A
fibres, Stripping colour from —. (P) Kollm .. 154A
as filtering material 38R
grease; Separation of lanoline from —— (P) Metzger 272A
grease; Utilisation of —— 271R
or the like, Manufacture of —— (P) Korselt .. 482A
Machines for drying or carbonising —— (P) Charlesworth 12A
Machines for dyeing, scouring, and washing —. (P) Whitaker and Whitaker 484A
Machines for washing and scouring —— and similar operations. (P) Taylor 13A
piece or like scouring processes; Treatment of effluent from —. (P) Distillates, Ltd., and Jarmain 12A
Preparation of leuco compounds of vat dyestuffs for —. (P) Cassella und Co 634A
Printing discharges on —. Jaquet 293A
Printing white reserves on —— Battegay 293A
Process for increasing the durability of — —. (P) Meister, Lucius, und Brüning 13A
-scouring liquors; Treatment of —. (P) Kolsky, and Diamond Match Co 185A
Scouring of — in the raw state or at any of the various stages of manufacture (P) Hollis and Woodmansey 360A
Scouring — with volatile solvents Hey 185A
-silk textiles; Reducing the permeability of ——. Colombo 816A
substitute; Manufacture of —. from cellulose and similar solutions (P) Glanzfäden A.-G. 13A
supplies in France 358R
textiles; Reducing the permeability of —. Colombo 816A
Washing or scouring ——. (P) Poole and Davis .. 779A
Woollen fabrics dyed fast to milling; Improving the wearing quality of —. (P) Cassella und Co. 228A
goods, Increasing the resistance to wear of dyed ——. (P) Cassella und Co. 61A
piece goods; Scouring and milling of fancy —. Begg 483A
Works chemist: what he is and what he might be. Stanford 437R
Worts. *See under* Beer.
Writing; Determination of age of ink in ——. Mitchell 165R, 877A
Wulfenite; Concentration of —— and its separation from barite. Rolandi 195A
Extraction of molybdenum compounds from ——. (P) Deutsche Molybdaen-Werke 784A, 822A

X

***Xanthium echinatum* seeds**; Fatty oil of ——. Rhodes .. PAGE 604A
***Xantharrhœa* gum resin**; Extraction of ——. (P) Pooley and Strevens 697A
species; Resins from ——. Rennie and others .. 459A
Xanthosterol, a crystalline compound from bark of *Xanthoxylum Budrunga*. Dieterle 81A
Xanthoxylum Budrunga. Xanthosterol, a crystalline compound from bark of ——. Dieterle 81A
Xenon; Notes on ——. Collie 109B
X-ray fluorescence of organic and inorganic compounds. Newcomer 761A
plate holders and intensifying screens (P) Siemens und Halske A.-G. 834A
tubes; Removing gases from ——. (P) Coolidge, and General Electric Co. 56A*
X-rays; Production and uses of ——. Kemp 108B
o-Xylene; Trinitration of —— Marqueyrol and Loriette .. 528A
Xylidine; Mixture of α-naphthol and —— as flotation agent 28A
Use of —— in flotation. Robie 159A
s-Xylidine; Synthesis of ——. Haller and others .. 685A
Xylol; Manufacture of toluol from ——. (P) Houlehan, and Du Pont de Nemours and Co .. 328A, 442A
Xylolite; Manufacture of non-expanding —— (P) Kuhn 367A

Y

Yarn; Apparatus for scouring, dyeing, or otherwise treating with liquor —— (P) Walker 720A*
Apparatus for treating hanks of —— with liquids. (P) Lord 401A*
Apparatus for treating —— with liquids. (P) Going 514A, 514A*
Dyeing, washing, and similarly treating —— in the form of hanks, skeins, or the like (P) Annieq 445A
Machines for bleaching and similarly treating —— in rope form (P) Morley, and Bleachers' Assoc Ltd 228A
Machines for dyeing, washing, scouring, sizing, bleaching, and mercerising —— in hank form. (P) Lord and Lord 186A, 595A*, 625A*
Machines for treating articles such as —— with liquids (P) Schmidt 226A
Tensile strength of —— Krais 329A
textile; Impregnating ——. (P) Deutsche Pyroxitges. 445A
textile; Manufacture of durable ——. (P) Müller and Herzberg 103A
Waterproofing —— (P) Bohme A.-G. 292A
windings; Apparatus for drying —— (P) Jagenberg 263A
Yeast; Acid formation by ——. Roas and Leberle .. 168A
Action of chloropicrin on —— Bertrand and Rosenblatt 498A
Adaptability of —— to different temperatures Zikes 203A
Alcoholic fermentation by —— Köhler .. 732A
Analysis of —— Vautier 38A
Application of reducing action of —— in wine making Mathieu 309A
Autolysis of —— in its dependence on hydrogen and hydroxyl ions Dernby 120A
Catalytic decomposition of hydrogen peroxide by ——. Phragmén 107A
cell; Influence of surface active nonylic acid and amyl and octyl alcohols on the ——. Windisch and others 701A
cells; Behaviour of dyes towards —— Von Euler and Florell 244A
Characters of —— as it occurs in nature Jorgensen .. 129A
Chemical isolation of vitamins from —— Myers and Voeglin 509A
Degeneration and treatment of —— Heuss .. 669A
Effect of organic and inorganic substances on fermentation of ——. Masters and Maughan 796A
Enzymic activities of —— Bourn 202A
Extraction and concentration of vitamin of —— Osborne and Wakeman 131A
Factors which interfere with use of —— as test organism for the antineuritic substance (vitamin B) Sousa and McCollum 830A
fat; Nature of ——. MacLean and Thomas .. 604A
fermentation; Sulphurous acid and ——. Hagglund 580A
-foods 131B
Formation of fat in —— on solid media. Lindner and Unger 129A
Growth of —— in alkaline solutions. Von Euler and Svanberg 245A
growth-promoting stimulus; Relation of water-soluble, anti-neuritic, and water-soluble B vitamins to ——. Emmett and Stockholm .. 671A
Influence of sudden cooling, during or after fermentation, on ——, especially in respect of subsidence. Will 462A
Influence of temperature on various functions of ——. Elion 830A

Yeast—*continued*. PAGE
Influence of temperature and acidity on formation of invertase from ——. Von Euler and Svanberg .. 463A
Invertase and fermentation enzymes in top ——. Von Euler and Moberg 244A
-like fungi; Action of ultra-violet light on ——. Feuer and Tanner 636A
Maltase solutions from ——. Willstätter and others .. 760A
Manufacture of ——. (P) Verein der Spiritus-Fabrikanten in Deutschland 381A
Manufacture of —— from fermented musts, particularly fermented musts of molasses and sugar beet pulp. (P) Dupire 701A
Manufacture of foods or stimulants for promoting growth of —— in bread making. (P) Geere and Geers .. 556A
Manufacture of nutrient ——, especially for use as nitrogenous fodder, from waste waters of sugar factories. (P) Riedel 761A
Manufacture of pressed ——. (P) Verein der Spiritus-Fabrikanten in Deutschland 345A
Manufacture of pressed —— from worts containing little or no sugar. (P) 168A
Manufacture of rubber-like or leather-like masses from formaldehyde and ——. (P) Blicher and Krause .. 242A
Manufacture of —— from seaweed. (P) Bayer and Orlajensen 499A
Manufacture of —— using waste beetroot pressings and other expressed saccharine liquids. (P) Reinke .. 796A
Manufacture of —— with little or no production of alcohol (P) Verein der Spiritus-Fabrikanten in Deutschland 345A, 463A
masses; Extraction of fat from ——. (P) Kriegsausschuss fur pflanzl u tier Oele und Fette .. 756A
Nitrogen metabolism in *S. cerevisiæ* Lampitt .. 669A
nucleic acid; Structure of ——. Levene 246A
nucleic acid, Structure of ——. Ammonia hydrolysis. Levene 133A
nutrition and fermentation Bokorny 795A
Precipitating —— in fermented liquids, especially fermented worts of aero-yeast factories Verein der Spiritus-Fabrikanten in Deutschland 245A
Preservation of —— (P) Robertson 245A
Production of —— for fodder (P) Verein der Spiritus-Fabrikanten in Deutschland 246A
Production of formic acid by —— in media containing amides Thomas 421A
protein; Manufacture of medicinal preparations from basic dyestuffs and ——. (P) A.-G. Haaf und Co 833A
Rhythmic phenomena in growth and fermentation of —— Köhler 732A
Saccharomyces thermantitonum, Characters of —— after prolonged cultivation Von Euler and Laurin 555A
Sensitiveness of living —— towards hydrogen and hydroxyl ions Von Euler and Emberg .. 202A
Stimulating fat-formation in —— (P) Kriegsausschuss fur pflanzliche u tierische Oele u Fette .. 168A
Treating waste brewers' —— to render it suitable for baking purposes (P) Andreschou .. 701A
Treatment of brewers' or distillers' —— to obtain a food product resembling meat extract (P) O'Sullivan and others 39A
Utilisation of amides by ——. Thomas 77A
See also under Saccharomyces
Yellow A B and O B. *See under* Azo dyestuffs.
Yellow-tail fish oil *See under* Oils, Fatty.
Yohimbine and nucleic acid, Manufacture of readily soluble compounds of —— (P) Weinert 765A
Yucca; Treating —— for recovery of fibres. (P) Loehr .. 292A
Ytterbium earths, Separation of terbium and ——. Meyer and Muller 333A

Z

Zinc Allotropy of —— Bingham 660A
or its alloys; Coating metallic surfaces with ——. (P) Berlin-Burger Eisenwerk A.-G 303A
Alloys of copper, nickel and ——. Guillet 269A
alloys, Manufacture of ——
(P) Goldschmidt and others 457A
(P) Kammerer 372A
(P) Tedesco, and Stabilimenti Biak 695A
alloys, Study of cast —— with special reference to their use as bearing metals. Gieren 158A
alloys; Utilisation of German supplies of pyrophoric ——. Guertler 67A
alloys, Utilisation of waste pyrophoric ——. Czochralski and Lohrke 630A
-aluminium alloys; Improving the mechanical properties of ——. (P) Heddernheimer Kupferwerk u. Süddeutsche Kabelwerke 415A
-aluminium-copper alloy, Corrosion of a screw fitting made of ——. Bauer 661A
-aluminium-copper alloys Rosenhain and others 109B, 370A
-aluminium-copper alloys rich in zinc. Schulz and Wachlert 369A
aluminium-copper; The ternary system —— with special reference to the zinc corner of the equilibrium diagram. Jares 67A

—continued.
Aluminothermic process of obtaining corundum and ——. (P) Rütte und Erz Ges. 882A
Analysis of commercial ——. Olivier 678A
battery elements; Electrolytic production of ——. (P) Gewerkschaft 986A*
-bearing ores; Treatment of ——. (P) Cameron and others 695A
blende; Roasting ——. (P) Feldtner und Ziegler, and Von Reeber 902A
Calculation of chemical constants of ——. Brauns .. 548A
concentrates; Electric furnace for reducing oxidised —— by carbon. (P) Thomson 29A
concentrates; Government purchase of Australian—— concentrates; Roasting —— in suspension. Fulton and Read 660A
content of reagents and apparatus. Weltzel 317A
-copper alloys; Magnetisability of ——. Weber .. 929A
-copper alloys prepared by melting or by electro-deposition; Chemical and electrochemical properties of ——. Saurwald 661A
and copper; Constituents formed by interpenetration of —— at temperatures below melting points of the metals and their alloys. Weiss 575A
-copper-lead alloys; Manufacture of ——. (P) Arend 117A
pper ores; Treatment of complex ——. Hommel.. 160A
blocks of manganese and —— in presence of phosphates and arsalates. Schmidt 530A
ermination of —— in organic materials, *e.g.*, urine, faeces, foods, etc. Weltzel 317A
stillation; Determination of quantity of gas evolved during ——. Mühlhaeuser 752A
stillation process; Utilisation of residual ash from ——. (P) Schlesische A.-G. für Bergbau u. Zinkhüttenbetrieb 662A
ust; Influence of foreign gases on formation of —— during condensation of zinc vapours. Ravner .. 786A
ust; Rotary electric furnaces for continuously melting ——. (P) Cornelius 725A
xperimental determination of vapour pressure curve of molten ——. Brauns 548A
xtraction of ——. (P) Bergiund and Hultt 303A*
xtraction of —— from galvanised iron in the open-hearth furnace, with recovery of zinc oxide. Müller 698A
xtraction of lead and —— from ores. (P) Elmore .. 603A*
urnace; Combustion chamber of the Hegeler ——. Mühlhaeuser 300A
urnace refractories. Audley 237A
urnaces; Determination of thermal conditions of ——. Mühlhaeuser 412A
dustry in Australia 304R
dustry in France 167R
dustry in Japan 289R
and alloys. (P) Falkenberg 725A
and-copper ores; Treatment of complex ——. Hommel 160A
at lead deposits of Gaspe. Beidleman 70R
and ores; Treatment of complex ——. Hommel .. 160A
nanganese alloys. Siebe 27A
anufacture of alloys of lead, copper, and ——. (P) Vereinigte Hüttenwerke Burbach-Eich-Dödelingen A.-G. 161A
anufacture of alloys of lead, copper, tin, and ——. (P) Vereinigte Hüttenwerke Burbach-Eich-Dödelingen A.-G. 161A
anufacture of good workable —— from inferior material. (P) Siemens-Schuckertwerke Ges. .. 872A
easurement of minimum thickness of deposits of —— by their electromotive force. Procopiu 116A
ines in Finland 258R
melter; Colouring matter formed in old fragments of —— and changes due to muffle and furnace gases. Mühlhaeuser 454A
re; Manufacture of briquettes of —— suitable for smelting. (P) Schlesische A.-G. für Bergbau u. Zinkhüttenbetrieb 662A
ues; Electric resistance furnaces for treatment of ——. Fulton 193A, 194A
ues, residues, dust ashes; Utilisation of low-grade ——. Wolbling 66A
ulphet of Canada 112R
tching and etching of —— for micro-examination. Hayne 300A
ntroduction; Methods for analytical control of electrolytic —— Bradley 336A
roduction of U.S.A. in 1919 .. .. 115R
ductions of metallurgy of ——. Lemarchands .. 336A
ecovery of copper and —— from burnt pyrites. (P) Rohrmeyer 662A
efinery of —— by electrolysis. (P) Stevens, and Electrolytic Zinc Co. of Australasia Proprietary, Ltd. 814*, 735A, 735A*
efinery of —— from low-grade and complex ores. Keyes and Robison 194A
olubilising fluorides. (P) Shipton 7.4A
olving —— (P) Stevenson 872A
olving powder. Manufacture of ——. (P) Johnson 302A
ulphet formed by reduction of —— by reduction of zinc oxide. (P) 402A
ulphet solutions; Treatment of ——. (P) Mühlhaus .. 876A
ulphide; Determination of mineral constituents of blende in ——. 782A
ulphide; Rhombic ——, an allotropic form of sphalerite. 68A

—continued.
recovery; Electrolytic deposition of ——. Hoover .. 814A
sulphate; Purification of ——. Electrolytic Zinc Co. of Australasia, Ltd. 814A
-bearing —— from lead-zinc pyrites. (P) Elmore .. 603A
Separating and recovering cadmium and ——. (P) Elmore 603A
smelting in Norway 112R
Solubility of —— in cyanide solutions. White 872A
solutions; Purification of ——. (P) Fleck and Metals Extraction Corp. 872A, 876A* (P) Salman and others 872A, 876A* 814A*
solutions; Treatment of ——. (P) Petersen, and Metals Extraction Corp. 876A
sulphide ores; Roasting —— preparatory to leaching. (P) Electrolytic Zinc Co. of Australasia Proprietary, Ltd. 603A
Theoretical principles underlying metallurgy of ——; Jänecke 695A
Treatment of residues containing copper, cadmium, and ——. (P) Elton and others 814A
Treatment of zinc-bearing ores for recovery of —— by electro-deposition. (P) Gepp and others 814A*
Treatment of zinc solutions preparatory to recovery of —— by electro-deposition. (P) Avery and others 603A*
Volumetric estimation of ——. Houben 98A
wire; Producing an alteration of structure of —— by heating during winding. (P) A.-G. Brown, Boveri, and Co. 406A
See also Spelter.
Zinc chloride; Manufacture of ——. (P) Storey, and Burgess Laboratories 733A*
compounds; Manufacture of pure —— from impure materials. (P) Bayer und Co. 160A
compounds; Manufacture of soluble —— from roasted zinc ores. (P) Eisenegger 406A
oxide; Manufacture of ——: (P) Breyer and others .. .. 22A (P) Singmaster and others 22A
oxide; Manufacture of hydrogen and ——. (P) McKee 819A
oxide, phosphorus pentoxide, and water; The system —— at 25° and 37° C. Eberly and others 595A
oxide pigments; Manufacture of ——. (P) American Zinc, Lead and Smelting Co., and Womple .. 122A*
oxide plant in Canada 147R
oxide; Recovery of —— by treatment of galvanised iron in the open-hearth furnace. Müller 698A
oxide-sodium oxide-water; Equilibrium in the system ——. Goudriaan 156A
oxide; Treatment of ——. (P) Breyer and others .. 429A
oxide; Treatment of zinc and zinc-containing materials for production of ——. (P) Macconchie and De Ros 448A
phosphates. Eberly and others 595A
sodium sulphate; Manufacture of ——. (P) Bayer und Co. 160A
sulphate solutions; Purification of ——. (P) Comp. Prod. Chim. d'Alais et de la Camargue 294A
sulphide; Fusion of ——. Tiede and Schleede .. 747A
sulphide; Influence of crystalline form, flux, and actual fusion on phosphorescence of ——. Tiede and Schleede 747A
Zirconia; Separating —— from ores and minerals. (P) Gordon 867A
-silica; Approximate determination of melting-point diagram of system ——. Washburn and Libman.. 928A
Zirconium; Determination of ——. Smith and James .. 700A
Determination of —— by the phosphate method. Lundell and Knowles 46A
Determination of —— in steel. Lundell and Knowles .. 574A
-lead alloys; Manufacture of ——. (P) Petinot, and U.S. Ferro-Alloys Corp. 415A
Manufacture of —— from its ores or oxide. (P) North and Loosli 729A
Metallic ——. Marden and Rich 130R
minerals; Analysis of ——. Thompson 130R
ore; Analysis of Brazilian ——. Powell and Schoeller 67A
Separation of iron, aluminium, chromium, glucinum, titanium, and —— by means of sodium carbonate. Wenger and Wuhrmann 46A
Separation of titanium and —— as phosphates. Brown and Madden 914A
-steel; Manufacture of ——. (P) Sicard, and U.S. Ferro-Alloys Corp. 415A
-titanium-iron alloys; Manufacture of ——. (P) Siegel, and U.S. Ferro-Alloys Corp. 415A
Zirconium carbide; Manufacture of alloys containing ——. (P) Petinot, and U.S. Ferro-Alloys Corp. .. 415A
compounds; Manufacture of ——. (P) Burton, and Titanium Alloy Manufacturing Co. 817
monoxide; Question of existence of ——. Bohnson and Dehler 92A, 220
oxide; Manufacture of ——. (P) Burton, and Titanium Alloy Manufacturing Co. 820
oxide; Preparation of ——. Marden and Rich .. 820
potassium fluoride; Preparation of ——. Hilton and Rich 820
sulphate, basic; Manufacture of ——. (P) Titanium Alloy Manufacturing Co. 820
Zirconyl-acetic acid; Manufacture of ——. (P) [illegible] 827
Zirconyl-acetic acid; Manufacture of ——. (P) [illegible] 820

Oil wells Perforated casing and screen pipe in Wash 264R
Petroleum and allied substances in 1918, Bibliography of Burroughs 24R
Petroleum investigations and production of Manning 84R
Petroleum Removal of the higher hydrocarbons from — by continuous distillation Wadsworth 350R
Quartz crystals in the United States during 1918 Fay 264R
Rocks Determination of combustible matter in silicate and carbonate Fieldner, Selvig, and Taylor 84R
Steel Uses of — as a warning in mines Katz, Allison, and Ley 424R
War gas investigations Manning 1.
Zinc Recovery of from low-grade and complex ores Lyon and Raleigh
United States Geological Survey publications
Abrasive materials in 1918 Katz
Arsenic, Bismuth, selenium, and tellurium in 1918 Hill
Asbestos in 1918 Diller
Asphalt and allied substances in 1918, Ostrom
Barytes and barium products in 1918 Stone
Bauxite and aluminium in 1918 Hill 264R
Building operations in the larger cities in 1918 Middleton
Cadmium in 1918 Siebenthal
Chromite in 1918. Diller, Bliss, Aldrich, and Burchard

PAGE

United States Geological Survey publications—*continued.*

Clay-working industries, silica brick, and building operations in larger cities in 1918. Middleton 406R

Coal in 1917. Part II. Distribution and consumption. Lesher 24R

Coal in 1918 Part A. Production Lesher 314R

Cobalt, molybdenum, nickel, titanium, tungsten, radium, uranium, and vanadium in 1917 Hess 424R

Cobalt, molybdenum, tantalum, titanium, radium, uranium, and vanadium in 1918 Hess 400R

Concrete, stone, and building blocks. Architectural —— in 1917 and 1918. Loughlin 174R

Copper in 1917 Butler 282R

Copper in 1917 (General report) Luther 314R

Copper in 1918. Butler 424R

Feldspar in 1918 Beach 314R

Fluorspar and cryolite in 1918 Burchard 122R

Gasoline, Natural gas —— Survey 406R

Gold and silver in 1918 Dunlop 406R

Gold, silver, copper, and lead in South Dakota and Wyoming in 1918 Henderson 24R

Gold, silver, copper, lead and zinc in California and Oregon in 1918 Yale 264R

Gold, silver, copper, lead, and zinc in Colorado in 1917 Henderson 264R

Gold, silver, copper, lead, and zinc in Eastern States in 1918 Hill 122R

Gold, silver, copper, lead, and zinc in New Mexico and Texas in 1917 Henderson 24R

Iron ore, pig iron, and steel in 1918 Burchard 264R

Lead in 1917 Sloshthal 282R

Lime in 1918 Loughlin and Insley 406R

Magnesium in 1919 Stone 424R

Manganese and manganiferous ores in 1917. Hewett 24R

Manganese and manganiferous ores in 1918. Hewett 264R

Mica in 1918 Schaller 314R

Mineral production of United States in 1917. McCaskey and Clark 406R

Mineral resources of United States in 1916 Part I Metals Part II. Non-metals 350R

Mineral resources. Work on —— done by U S Geological Survey Bastin and McCaskey 174R

Mineral waters in 1918 Ellis 174R

Nickel in 1918 Hess 406R

Peat in 1918. Osbon 24R

Peat in 1919 Cottrell 406R

Platinum group metals. Bibliography of ——, 1748-1917 Howe and Holtz 350R

Potash in 1918 Hicks 174R

Quicksilver in 1918 Ransome 24R

Rocks, Analysis of silicate and carbonate —— Hillebrand 350R

Sand and gravel in 1918 Stone 24R

Silica in 1918 Catz 122R

Stone in 1918 Loughlin and Coons 424R

Strontium in 1918. Stose 174R

Talc and soapstone in 1918 Diller 174R

Thallium zirconium, and rare earth minerals in 1919 Schaller 424R

Verre Le soufflage du —— dans les laboratoires scientifiques et industriels Vigreux 264R

Volatile oils Vol II Gildemeister and Hoffmann (translated by Kremers) 388R

Water, Chlorination of —— Race 46R, 156R

Writing, Art of technical —— Rickard 448R

Yeasts Guillermond (translated and revised by Funk) 424R

List of Journals Abstracted, with Abbreviations Used, and Addresses of Publishers and Prices.

Journal.	Abbreviation.	Address of Publisher and Price.*
Agricultural Bulletin of the Federated Malay States	Agric Bull. F M S. ..	Dept. of Agriculture, Kuala Lumpur, F M S. $1.5.
Agricultural Journal of India	Agric J. India ..	W. Thacker and Co., 2, Creed Lane, London. 3s
Agricultural Ledger ..	Agric Ledger	Reporter on Economic Products to the Government of India. Calcutta
Agricultural Research Institute, Pusa, Report and Bulletins	Rep. (Bull.) Agric. Res. Inst, Pusa.	Supt. Govt Printing, Calcutta. Price varies.
Allgemeine Zeitschrift für Bierbrauerei und Malzfabrikation	Allgem. Z. Bierbrau.	Michaelerstrasse 25, Vienna XVIII/1. 150 fr. per annum.
American Journal of Pharmacy.	Amer. J. Pharm. ..	145, North Tenth Street, Philadelphia, Pa., U.S.A. 30 cents
American Journal of Science	Amer. J Sci ..	New Haven, Conn., U.S.A. 50 cents.
Anales de la Sociedad Española de Fisica y Quimica	Anal. Soc Espan. Fis Quim	D M F Gil Corredera Baja de San Pablo, núm. 59, Madrid. 15 pesetas per annum
Anales de la Sociedad Quimica Argentina	Anal. Soc. Quim. Argentina	1790, Livalle, Buenos Aires. 6 p c
Analyst	Analyst	Simpkin, Marshall, Hamilton, Kent and Co., Ltd., 2, 4, 6, 8, Orange Street, London, S.W. 3s
Annalen der Chemie	Annalen	C. F. Winter'sche Verlagshandlung, Leipzig, Germany. M. 60 per annum
Annales de Chimie	Ann. Chim. .. .	Imprimerie Gauthier-Villars et Cie., Quai des Grands-Augustins, 55, Paris 40 fr per annum
Annales de Chimie Analytique	Ann Chim Analyt .	M Crinon 20 Boulevard Richard-Lenoir Paris. 2 fr.
Annales des Falsifications.	Ann Falsif . .	M Filandeau, 42 bis Rue de Bourgogne Paris VII. 3 fr
Annales de l'Institute Pasteur	Ann Inst Pasteur .	Masson et Cie, 120, Boulevard St Germain, Paris, 6 4 fr.
Annales de la Science Agronomique Française et Etrangère	Ann Sci Agron. .	Librairie Berger Levrault, 5, rue des Beaux Arts, Paris, 6e. 10 fr 25
Annali di Chimica Applicata	Annali Chim Appl .	Title now altered to Giornale Chimica Industriale ed Applicata
Annali della R Stazione Chimico Agraria Sperimentale di Roma	Ann R Staz Chim Agrar Sperim Roma	R Stazione Chimico Agraria Sperimentale di Roma, Rome.
Apotheker-Zeitung ..	Apoth-Zeit .. .	Levetzowstrasse 16b Berlin N W 87. M 1 20.
Archiv der Pharmazie .	Arch Pharm . ..	Selbstverlag des Deutschen Apotheker-Vereins, Berlin, Germany £1 18s per annum.
Archives des Sciences Physiques et Naturelles	Arch Sci Phys Nat	Rue de Vieux Collège 4, Geneva, Switzerland 6 fr
Archivio di Farmacologia Sperimentale e Scienze Affini.	Arch Farm Sperim .	Via Depretis, 92, Rome Lire 2.
Atti della Reale Accademia dei Lincei, Roma	Atti R Accad. dei Lincei, Roma	Tipografia della R Accademia dei Lincei, Rome Lire 10 per annum
Australasian Pharmaceutical Notes and News	Austr Pharm Notes and News	Elliott Bros., Ltd., O'Connell St., Sydney, N.S.W. 3d.
Berichte der Deutschen Chemischen Gesellschaft	Ber.	R Friedländer und Sohn, Karlstrasse 11, Berlin, N.W. 6, Germany £2 5s per annum
Berichte der Deutschen Pharmazeutischen Gesellschaft.	Ber deuts. Pharm. Ges.	Verlag von Gebr Borntrager, Berlin, W. 35, Schöneberger Ufer 12A, Germany 15s. per annum
Berichte des Ohara Instituts für landwirtschaftliche Forschungen	Ber Ohara Inst landw. Forsch.	Verlag der Ohara Schonokai, Kurashiki Provinz Okayama. Price varies
Biedermann's Zentralblatt	Biedermann's Zentr. ..	O Leiner, Königstrasse 26B, Leipzig, Germany. M 36 per annum
Biochemical Journal	Biochem J.	Cambridge University Press Fetter Lane, London, E.C. 14s.
Biochemische Zeitschrift ..	Biochem Zeits. ..	Verlag von J Springer, Berlin, W 9, Linkstrasse 23-24. M. 48 per volume
Blast-Furnace and Steel Plant	Blast - Furnace and Steel Plant	Thaw Building, 108, Smithfield St., Pittsburgh, U.S.A. 25 cents.
Board of Trade Journal ..	Bd. of Trade J. ..	Messrs. Wyman and Sons, Fetter Lane, London, E.C. 6d.
Bollettino Chimico Farmaceutico	Boll. Chim. Farm. ..	Via Cappucio, 19, Milan, Italy. 60 cents.

* The price for single copies is given where these are sold separately. In other cases it is only possible to buy the Journals in question in complete volumes. For many of the German and Austrian Journals special prices are charged to foreign purchasers; the actual cost is given where possible.

JOURNAL.	ABBREVIATION.	ADDRESS OF PUBLISHER AND PRICE.
Brennstoff-Chemie	Brennstoff-Chem. ..	Verlag W. Girardet, Essen. M. 2.50.
Brewers' Journal	Brewers' J.	L. M. Reed, Eastcheap Buildings, Eastcheap, London, E.C. 3. 3s.
British Journal of Photography	Brit. J. Phot. ..	24, Wellington Street, London, W.C. 2. 4d.
Buletinul Societăței de Chimie din Romănia	Bul. Soc. Chim. Romănia	Boulevard Carol, 32, Bucarest.
Bulletin de l'Association des Chimistes de Sucrerie et de Distillerie	Bull. Assoc. Chim. Sucr.	156, Boulevard Magenta, Paris, 10e, France. 4 fr.
Bulletin of Agricultural Intelligence and of Plant Diseases	Bull. Agric. Intell. ..	International Institute of Agriculture, Rome. 2 fr.
Bulletin of the Forest Experiment Station, Meguro, Tokyo	Bull. Forest Exp. Stat., Meguro	Bureau of Forestry, Dept. of Agriculture and Commerce, Tokyo.
Bulletin of the Institution of Mining and Metallurgy	Proc. Inst. Min. and Met.	1, Finsbury Circus, London, E.C.
Bulletin of the Kentucky Agricultural Experiment Station	Bull. Kentucky Agric. Exp. Stat.	University of Kentucky, Lexington, Ky., U.S.A.
Bulletin of the Rubber Growers' Association (Incorporated)	Bull. Rubber Growers' Assoc.	38, Eastcheap, London, E.C. 3
Bulletin of the School of Mines and Metallurgy, University of Missouri	Bull. School Mines and Met., Univ. Missouri	Director of Mining Experiment Station, Rolla, Mo., U.S.A.
Bulletin de la Société de Chimie Biologique	Bull. Soc. Chim. Biol.	Dunod, Successeur de H. Dunod et E. Pinat, 47 & 49, Quai des Grands Augustins, Paris (VI.) 3 fr.
Bulletin de la Société Chimique de Belgique	Bull. Soc. Chim. Belg.	M. J. Wauters, Palais du Midi (Galerie du Travail 7), Brussels
Bulletin de la Société Chimique de France	Bull. Soc. Chim. ..	Masson et Cie., 120, Boulevard Saint Germain, Paris, 6e. 35 fr. per annum
Bulletin de la Société Française de Photographie	Bull. Soc. Franç. Phot.	51, Rue de Clichy, Paris, 9e. 2 fr.
Bulletin de la Société Industrielle du Nord de la France	Bull. Soc. Ind. Nord.	Rue de l'Hôpital Militaire 116, Lille, France
Bulletin de la Société Industrielle de Mulhouse	Bull. Soc. Ind. Mulhouse	Berger-Levrault et Cie., 5, Rue des Beaux Arts, Paris. 60 fr. per annum
Bulletin de la Société d'Encouragement pour l'Industrie Nationale	Bull. Soc. d'Encour. .	Secrétariat, Rue de Rennes 44, Paris, France. 36 fr. per annum.
Canadian Chemical Journal	Canad. Chem. J. .	Watman, Ltd. 72, Queen Street West, Toronto. 25 cents
Le Caoutchouc et la Gutta-Percha	Caoutchouc et Gutta Percha	A. D. Cillard fils, 49, Rue des Vinaigriers, Paris, X. 36 fr. per annum
Cellulose Chemie	Cellulose Chem.	Supplement to Papierfabrikant
Chamber of Commerce Journal	Ch. of Comm. J. .	Oxford Court, Cannon Street, London, E.C. 6d.
Chemical Age	Chem. Age	Bean Bros., Ltd., 8, Bouverie Street, London, E.C. 4. 6d.
Chemical and Metallurgical Engineering	Chem. and Met. Eng.	McGraw-Hill Co., 10th Avenue at 36th Street, New York. 25 cents
Chemical News .. .	Chem. News .. .	E. J. Davey, 97, Shoe Lane, London, E.C. 4. 6d.
Chemical Trade Journal .	Chem. Trade J. .	Davis Bros., Danes Inn House, 265, Strand, London, W.C. 2.
Chemiker-Zeitung .. .	Chem. Zeit. .. .	Dr. W. Roth, Cothen, Anhalt, Germany. £1 10s. per annum
Chemisch Weekblad . .	Chem. Weekblad ..	D. B. Centen, O.Z. Voorburgwal 115, Amsterdam. 0.25 fr.
Chemische Industrie ..	Chem. Ind. .. .	Weidmann'sche Buchhandlung, Zimmerstrasse, 94, Berlin, S.W., Germany. M. 50 per annum.
Chemische Umschau auf dem Gebiete der Fette, Oele, Wachse, und Harze	Chem. Umschau ..	Verlag der Chemischen Umschau, Friedrichstrasse 4, Stuttgart. M. 3 (4s. 7d. 6d. per annum)
Chemisches Zentralblatt ..	Chem. Zentr.	R. Friedländer und Sohn, Karlstrasse 11, Berlin, N.W. 6, Germany. £2 per annum
Chemist and Druggist ..	Chem. and Drug. .	42, Cannon Street, London, E.C. 9d.
Chimie et Industrie	Chim. et Ind.	49, Rue des Mathurins, Paris. 10 fr.
Collegium	Collegium .	K. Schorlemmer, Haltingen, Baden, Germany. 2s.
Communications of the Netherlands Government Institute for advising the Rubber Trade and Rubber Industry	Comm. Netherlands Govt. Inst. for advising Rubber Trade	
Comptes Rendus hebdomadaires des Séances de l'Académie des Sciences	Comptes rend.	Imprimerie Gauthier-Villars, Quai des Grands Augustins 5 Paris. 140 fr. per annum.
Comptes-Rendus des Travaux de Laboratoire de Carlsberg	Comptes rend. Trav. Lab. Carlsberg	H. Hagerup, Copenhagen. Price varies.

JOURNAL.	ABBREVIATION.	ADDRESS OF PUBLISHER AND PRICE.
Deutsche Zuckerindustrie ..	Deuts. Zuckerind. ..	Dessauerstrasse, 18, Berlin, S.W.11. M. 30 per vol.
Elektrochemische Zeitschrift	Elektrochem. Zeits. ..	Brandenburgische Buchdruckerei u. Verlagsanstalt Ges., Muhlenstrasse, 9, Berlin-Schoneberg, Germany. M. 2.25.
Engineering	Engineering	C. R. Johnson, 35 and 36, Bedford Street, Strand, London, W.C. 1s. 2d.
Engineering and Mining Journal	Eng. and Min. J. ..	McGraw-Hill Publishing Co., 10th Avenue at 36th Street, New York City. 25 cents.
Farben-Zeitung	Farben-Zeit	Krausenstrasse 35 36, Berlin, S.W. 19. 15s. per annum.
Färber-Zeitung ..	Färber Z it.	Title now changed to Textilbericht.
Feuerungstechnik	Feuerungstechn. ..	O. Spamer, Taubschenweg 26, Leipzig-R., Germany. M. 10 per quarter.
Gas Journal	Gas J. ..	W. King, 11, Bolt Court, Fleet Street, London, E.C.4. 1s.
Gas- und Wasserfach	Gas- u. Wasserfach ..	R. Oldenbourg, Gluckstrasse, 8, Munich. £1 6s. 8d. per annum.
Gas World	Gas World	8, Bouverie Street, E.C. 4. 8d.
Gazzetta Chimica Italiana .	Gazz. Chim. Ital. ..	La Direzione della "Gazzetta Chimica," Via Tre Novembre, 154, Rome. Lire 70 per annum.
Gerber . ..	Gerber	Clarystrasse, 4, Teplitz-Schonau. 25s. per annum.
Gesammelte Abhandlungen zur Kenntnis der Kohle	Ges. Abhandl. Kenntn. Kohle	Gebr. Borntrager, Schoneberger Ufer, 12a, Berlin, W.35. Vols. 1 to 3, M. 80, Vol. 4, M. 85.
Giornale di Chimica Industriale ed Applicata	Giorn. Chim. Ind. Appl.	Via S. Paolo, 10, Milan, Italy. L. 5.
Gluckauf .	Gluckauf . . .	Verlag Gluckauf, Essen. M. 17.50 per quarter.
Gummi Zeitung	Gummi Zeit . .	Geschaftsstelle der "Gummi Zeitung," Krausenstrasse 35 36, Berlin, S.W. 19, Germany. 15s. per annum.
Helvetica Chimica Acta .	Helv. Chim. Acta ..	Georg & Co., 10, Freistrasse, Basel. £1 5s. per annum.
Imperial Institute Bulletin..	Bull. Imp. Inst. ..	John Murray, Albemarle Street, London, W. 2s. 6d.
India Rubber Journal .	India Rubber J. ..	Maclaren and Sons, 37 and 38, Shoe Lane, London, E.C. 4d.
International Sugar Journal	Int. Sugar J. . ..	2, St. Dunstan's Hill, London, E.C. 1s. 9d.
Internationale Zeitschrift fur Metallographie	Internat. Z. Metallog.	Gebr. Borntrager, Schoneberger Ufer 12a, Berlin, W.35. M. 40 per annum.
Journal of Agricultural Research	J. Agric. Res ..	U.S. Department of Agriculture, Washington, D.C., U.S.A. Price varies.
Journal of Agricultural Science	J. Agric. Sci.	University Press, Cambridge. 10s.
Journal of the American Ceramic Society	J. Amer. Ceram. Soc.	211, Church Street, Easton, Pa., U.S.A. 60 cents.
Journal of the American Chemical Society	J. Amer. Chem. Soc.	C. L. Parsons, 1709, G. Street, N.W. Washington, D.C., U.S.A. 75 cents.
Journal of the American Institute of Metals	J. Amer. Inst. Metals	10, Depot Street, Concord, N.H., U.S.A. $3.
Journal of the American Leather Chemists' Association	J. Amer. Leather Chem. Assoc.	American Leather Chemists' Assoc., Easton, Pa., U.S.A. $12 per annum.

List of Errata, 1920.

No. of Journal.	Page	Column	Line from top	Line from bottom	Corrigenda
No. 1—Jan. 15 ..	24A	1	—	38	*For* "Anderson" *read* "Andersen."
" " ..	35A	1	—	28, 29	*Delete* "(1900) Substitutes for celluloid, vulcanite or the like."
No. 2—Jan. 31 ..	19T	2	—	—	In the "Softening" graph, curve C refers to high grade, not to low grade, batata.
" " .	61A	1	12, 14 and 17	—	*For* "anthocyins" *read* "anthocyanins."
" " .	71A	1	4	—	*For* "polarising" *read* "depolarising."
" " .	74A	2	2	—	*For* "1,428,878" *read* "1,428,878."
No. 3—Feb. 16 ..	97A	1	—	—	Line 16 from top should follow line 13.
No. 4—Feb. 28 .	170A	1	24	—	*For* "Mennal" *read* "Menzil."
" " .	177A	2	—	4	*For* "Constantino" *read* "Costantino."
No. 5—Mar. 15 .	66T	1	25	—	*Replace by* "which are relished by cattle, but it is doubtful."
" " .	196A	1	—	19	*For* "Gillet" *read* "Gallet."
No. 7—Apr. 15 .	136R	2	22		*This line should read* "Canadian trade in period Jan. 1919 to Jan. 1920. During this period Canada."
" " .	136R	2	34		*Delete* "to 1920."
No. 8—Apr. 30 .	209A	1		24	*For* "Matthew" *read* "Martin."
No. 9—May 15 .	222A	1	20		*For* "1, 22 65." *read* "1, 22 65."
No. 11—June 15 .	197R	1	—	—	*In bottom line, for* "6" *read* "115."
" "	203R	2			*In last two columns of table, for* "1917-18" *and* "1918-19" *read* "1918-19" *and* "1919-20."
" "	439A	1		20	*For* "Hillis" *read* "Hollis."
No. 12—June 30 .	215R	2	34		*For* "J. R. McLellan" *read* "J. C. McLennan."
" "	215R	2	—	20	*For* "McLellan" *read* "McLennan."
No. 13—July 15 .	476A	1	25	—	*For* "1,424,417" *read* "1,430,643."
" " .	489A	1		13	*For* "Parodox 241.20" *read* (A) 1,139,744 and (B) 1,139,545, 11.20. April 9-15."
No. 14—July 31 .	195T	1	—	41	*For* "all cases" *read* "many cases."
" " .	195T	2	14		*For* "quality" *read* "gravity."
" " .	195T	2		19	*For* "40%" *read* "50%."
" " .	196T	1		23	*For* "100 lb. ft." *read* "1000 lb. ft."
" " .	196T	2	34		*After* "gasoline (B.Th.U." *insert* "this may amount to as much as 14 per gallon of motor spirit)."
" " .	224T	2	3, 5	—	*For* "His experience" *read* "Lead stored in the open be are severely carbonated in a short time after heavy rains, but this was not the case with lead containing perhaps 2% Cu."
No. 15—Aug. 15 .	557A	1	31	—	*For* "Rappel" *read* "Ruppel."
No. 16—Aug. 31 .	563A	1	9	—	*For* "Waite" *read* "Walt."
No. 20—Oct. 30 .	666A	2	7	—	*For* "on Schlegell" *read* "Von Schlegell."
No. 22—Nov. 30	398R	1	—	17	*For* "professional" *read* "professorial."
" " .	765A	1	—	6	*For* "Bechninger" *read* "Bechringer."
No. 23—Dec. 15 .	415R	2	—	13	*For* "carbonisation" *read* "carbonatation."
" " .	802A	1	7-8	—	*For* "Trim-thyl m cresolic" *read* "Trimethylacetyl-m-cresolic."
" " .	804A	1	33	—	*For* "Z. Anal. Chem., 1920, **59**, 297-302" *read* "Helv. Chim. Acta, 1920, **3**, 652-653."
No. 24—Dec. 31 .	432R	1	17	—	*For* "G. P. Morrell" *read* "R. S. Morrell."
" " .	817A	2	—	5	*For* "Allen" *read* "Allan."
" "	818A	2	17	—	*For* "Jäecke" *read* "Jänecke."
" " .	830A	2	17	—	*For* "Bassett" *read* "Bassett."

JOURNAL OF THE SOCIETY OF

CHEMICAL INDUSTRY

Vol. XXXIX. No. 1 January 15, 1920

REVIEW

REPORTS ON PROGRESS IN CHEMICAL INDUSTRY IN 1919.

In continuance of its policy of keeping chemists and allied technologists supplied with up-to-date and authentic information, the Council of the Society of Chemical Industry has decided to publish a fourth volume of its *Annual Reports on the Progress of Applied Chemistry* covering the year 1919. The publication is now too well known to require any detailed description of its nature and objects, and it must suffice to state that the reports take the form of monographs written by acknowledged experts in the various branches of chemical technology. The method of treatment is two-fold in character. In the first place the writers aim at presenting an accurate and reasonably complete, objective account of progress achieved; and in the second, they seek to present a well-balanced survey, throwing the events they record into proper prospective, and, where occasion requires, interpreting them in the light of their individual experience.

The demand for the three Reports already issued (Volume I. has been out of print for some time), and the reception given to them by the scientific and technical press, bear testimony to the success attained by the writers in carrying out the intentions of the Council, and there can be no doubt that the experience gathered with each successive volume will ensure increased efficiency and utility in those that follow. It is satisfactory to note that there has been no duplication or overlapping in the production of reports on industrial chemistry; the Society's publication occupies a unique place in the literature of chemical science, and for this reason alone it should find a place in the library of every worker in this field. Satisfactory as has been the reception of the Reports in the past, it is felt that there is still scope for a wider circulation, more particularly in other English-speaking countries, and we would therefore draw the attention of our colleagues overseas to the imminent appearance of Volume IV., which, it is hoped, will be published during the month of March. The subjects treated and the respective contributors are as follows:—

Plant and Machinery: W. B. Davidson, M.A., D.Sc., Ph.D., F.I.C.
Fuel: J. T. Dunn, D.Sc., F.I.C.
Gas and Destructive Distillation: E. V. Evans, M.B.E., F.I.C.
Mineral Oils: A. E. Dunstan, D.Sc., F.I.C.
Colouring Matters and Dyes: F. M. Rowe, M.Sc., F.I.C.
Fibres, Textiles, etc.: S. S. Napper, A.C.G.I., F.I.C.
Bleaching, Dyeing, etc.: S. H. Higgins, M.Sc.
Acids, Alkalis, Salts: T. Ewan, M.Sc., Ph.D. F.I.C.
Glass, Ceramics, etc.: W. J. Rees.
Iron and Steel: A. McWilliam, D.Met.
Non-ferrous Metals: W. G. Wagner.
Electro-chemistry: A. J. Allmand, M.C., D.Sc.
Oils, Fats, Waxes: G. H. Warburton.
Paints, Pigments, etc.: J. H. B. Jenkins.
Indiarubber: D. F. Twiss, D.Sc., B.Sc., F.I.C.
Leather, Glue: F. C. Thompson, M.Sc.
Soils, Fertilisers: E. J. Russell, O.B.E., D.Sc., F.R.S.
Sugars, Starches, Gum: J. P. Ogilvie.
Fermentation Industries: A. Tait and L. Fletcher.
Foods: H. W. Bywaters, D.Sc., Ph.D., A.R.C.S., F.I.C.
Water Purification, Sanitation: Sir A. C. Houston, K.B.E., M.V.O., M.B., D.Sc.
Fine Chemicals, etc.: T. A. Henry, D.Sc.
Photographic Materials and Processes: R. E. Crowther.
Explosives: W. Rintoul, O.B.E., F.I.C.
Analysis: C. A. Mitchell, M.A., F.I.C.

As a preliminary to the issue of the new volume, it is thought that the immediate publication in the Journal of short summaries of some sections dealt with may be of interest and utility to our members and readers. These epitomes are necessarily of a somewhat sketchy character, and they can in no way be regarded as substitutes for the full accounts; they should serve to give the reader a very general, preliminary bird's-eye view of progress made and add interest to the subsequent study of the reports themselves. The short articles which follow in this and the next issue have been contributed by the authors of the reports, with the exception of that on the Fermentation Industries which has been supplied by Dr. A. Slator.

HEAVY CHEMICALS.

The literature of this first year of peace is still dominated by the war. Much of the work done during the war could not be published until after the termination of hostilities, and many interesting details have appeared for the first time during the year. The United States authorities have been more communicative than those in this country, in France or in Germany, although some light on the conditions in the latter country is being afforded by the visits of Allied representatives to the occupied areas. During the war the heavy chemical industry underwent great dislocation; for example, before the war about 3 per cent. of the million tons of sulphuric acid produced annually in this country was used in making explosives; during the war the production increased to 1¾ million tons, the greater part of which was used for explosives. A very considerable part of the increased production was in the form of oleum. The obvious impossibility of carrying on modern warfare without a supply of nitric acid forced all the belligerents to devote great attention to the provision of a supply within their own borders. Very considerable progress has, therefore, been made in the fixation of atmospheric nitrogen on a large scale. The very important synthesis of ammonia from its elements can be, as yet, regarded as an established industry only in Germany, where the output appears to have ex-

ceeded 150,000 tons of nitrogen in 1918—an extraordinary record considering the complexity of the plant and that operations began in 1913. The cyanamide process was also installed in all the principal countries taking part in the war, but doubts are expressed about its ability to compete commercially under normal conditions. The oxidation of ammonia to nitric acid, which was carried out on a relatively very small scale before the war, has assumed enormous proportions.

The energetic search for new sources of potash to take the place of the Stassfurt supply has met with a considerable measure of success. In America the production in 1918 reached about one-fifth of the pre-war consumption, and in this country it appears that there is sufficient potash in our blast-furnace dust to cover the home demand.

A very remarkable illustration of the facility with which the reputedly rarest substances can be obtained in quantity is afforded by helium, which it is proposed to use in place of hydrogen in airships. It appears that a potential supply of 180,000 cub. feet daily exists in a natural gas in Texas.

It is to be feared that much of the energy expended in devising new processes and in erecting the plant for working them will go to swell the wastage of the war. This applies to ammonium nitrate, the output of which, in this country alone, increased from 100 tons to 3,000 tons weekly; to silicon and titanium chlorides, which were used in producing smoke clouds, and to a smaller extent to chlorine, which entered into the composition of almost all of the poison gases used, and to sulphuric acid.

DYES.

A matter of primary interest and importance is undoubtedly the question of how far British manufacturers have succeeded in their endeavour to render this country independent of German dyes. The answer may be summarised in the statement that progress has been considerable but much yet remains to be done. As a result, little competition is to be feared in the commoner and cheaper dyes, but further development and increased output are necessary with regard to special and more expensive dyes, for the erection of plant has proved unable to keep pace with the progress of technical research. At the present time, the list of dyes which need never be purchased from Germany again is large and ever increasing, whilst the temporary products of the early days of the war have been replaced by standard products of recognised purity and value. (See also this J., 1919, 456 R.) The deficiency in the supply of certain dyes has been met to some extent by the importation from Switzerland of products manufactured largely from British and French raw materials and intermediates, which have replaced similar German materials upon which the Swiss were dependent formerly. The quantity of dyes now imported from Switzerland is only about one-sixth of the quantity which is being made by British manufacturers. The arrival and disposal of the first consignment of our share of the dyes due from Germany under the Peace Treaty should do much to ease the present situation and afford our manufacturers a breathing space in which to continue their development and consolidate their position. Given the plant, increased yields and improved working conditions will naturally follow as a result of practical experience, so that there is every reason to believe that the British colour industry may be established on a satisfactory basis during the next five years.

A few of the important additions to the number of colours manufactured in this country may be quoted here:—Alizarin Celestol, Solway Purple (Alizarin Irisole), Kymric Green (Alizarin Cyanine Green), Coomassie Violet (Formyl Violet S4B), Lissamine Green B (Wool Green S), Gallocyanine BD, Monolite Red R (Lithol Red R), Chloranthrene Red 5G (Algole Red 5G), Chloranthrene Bordeaux R (Indanthrene Bordeaux B), and bases for fur dyeing. Rhodamine will be placed on the market shortly. The annual report should be consulted for a complete record of the progress in technical and theoretical colour chemistry during the year 1919. Outstanding features, in the case of intermediate products, are the further development of processes for continuous sulphonation and the attention which has been devoted to the production and purification of N-alkylarylamines, whilst in the case of dyes a large amount of work has been carried out, principally in the azo-, triphenylmethane, sulphide, indigoid, and anthracene vat classes.

FINE CHEMICALS.

There are no remarkable developments to record in connexion with this group of chemical products in 1919. Much interest has been shown in the question of the supplies of cinchona bark, which for many years past have been drawn almost wholly from Java. A survey conducted in India by Colonel Gage shows that in the districts in which some cinchona is now grown, principally for the use of the Indian Government's small quinine factories, further plantations can be formed, but it it is suggested that cinchona cultivation might be undertaken on a large scale in the Tavoy district of Burma, and that a new quinine factory might be erected there to utilise the bark produced. This question is also receiving attention in the United States, where proposals for the utilisation of South American bark have been made.

In Germany, Morgenroth has investigated the action of a number of homologues of hydroquinine, chiefly with a view to ascertaining the influence of stereoisomerism on their physiological action. This author shows that eucupinotoxine is a more powerful anæsthetic than its structural isomeride eucupine (*iso*-amylhydrocupreine), and from forty to fifty times more powerful than cocaine.

During the war, when "Turkish opium" was unobtainable, Indian opium secured a footing in this country, and also in the United States, for the manufacture of morphine. Although the Indian drug proved to be richer in morphine than was generally supposed, it contains on the average, as marketed in this country, less morphine than Turkish or Persian opium. It is known that opium as rich in morphine as any of the commercial varieties can be and is produced in India, and it is understood that the botanical and chemical investigations now in progress there have already given results which indicate ways in which the average quality of the opium exported can be greatly improved.

Among the minor alkaloidal drugs, considerable progress has been made in elucidating the structure of hyoscine (King) and of scopoline, the basic hydrolytic product of hyoscine (Hess). Further, of seven alkaloids derived from mescal buttons, Späth has shown that one is identical with hordenine and the others closely related thereto.

Further details on the isolation of thyroxine, the active principle of thyroid gland, have been published by Kendall, but no particulars have yet appeared regarding the synthesis of this substance, which is stated to have been accomplished by Osterberg two years ago.

Of the many papers which have been published on essential oils and their constituents, the most interesting from an industrial point of view are those concerned with the utilisation of *p*-cymene, the chief constituent of "spruce turpentine," now available in large quantities as a by-product of the pulp industry. Methods have been devised for the

conversion of this hydrocarbon into carvacrol and p-aminocarvacrol (the latter is stated to be a promising photographic developer), whilst a method of preparing thymol from cymene has been protected. A number of Japanese essential oil-yielding plants has been examined, some of which may prove to be of commercial interest as sources of citral, geraniol, thymol and carvacrol.

The new synthetic drugs described during the year are for the most part mere variations on well-known types. Interest in organic arsenic derivatives shows no signs of slackening either in this country or in the United States. Perhaps the most notable work done in this connexion during the year is the preparation at the Rockefeller Institute of a series of arsenobenzenes and their intermediate products derived from *N*-phenylglycine-*p*-arsinic acid, all of which have been protected by patents. Judging from preliminary notices in the American medical press, certain of these compounds are likely to be of considerable therapeutic importance.

A considerable volume of patent literature relating to the manufacture from acetylene of acetone and the necessary intermediate products has recently been set free. These deal largely with details involved, but are of general interest as giving a considerable amount of information on obscure points in the series of reactions employed.

The foundation of an industry dealing with the production of organic research reagents has been discussed in this country, but in the United States manufacture on a small scale has actually started.

VEGETABLE OILS AND FATS.

The past year has been one of steady if slow progress. The enormous development of the margarine industry (the output is computed by one authority to have reached a total of 10,000 tons per week) has led to oils being used for edible purposes which a few years ago would have been considered as only fit for the soapmaker. This is in great part due to the expansion of the process of hydrogenation which has brought within the ken of the margarine maker consistent fats from vegetable oils and also fish oils to replace the oleo-margarine from beef fat. Even hardened castor oil has recently been suggested as a foodstuff.

The important subject of the amount and nature of the vitamines contained in oils and fats has received scant attention during the past year, and a reasonably quick and accurate method for determining these somewhat mysterious substances is still to be desired. It may be that the therapeutic effects of codliver oil hitherto supposed to lie in the easy assimilability of the glycerides of the highly unsaturated fatty acids is due to the presence of vitamines. Unfortunately they are probably destroyed by the high temperature required for hydrogenation. For the same reason a process, recently patented, of deodorising by blowing hydrogen through the oil at temperatures up to 300° C. must be regarded doubtfully pending further investigation.

The process of hydrogenation has attracted considerable attention of a scientific nature with the object of discovering the *rationale* of the addition of hydrogen, and on the technical side it has also been the subject of investigation.

The study of the hydrolysing effect of enzymes has been continued during the past year, mainly in the United States. The work done in this field, however, is of a purely scientific nature. Enzymes as a reagent in the commercial splitting of fats have been almost ousted by the Twitchell reagent; that the process is still being worked in some quarters is shown by a recent patent taken out for purifying the glycerin resulting from ferment hydrolysis. Various oils have been tried for their suitability for the manufacture of the Twitchell reagent, and the conclusion has been drawn that hydrogenated castor oil gives the best result as regards the colour of the final product.

A fair amount of work has been published on the determination of the characteristics of new oils and fats and on the re-examination of little-known oils. Some of the latter may become of commercial importance like "benefing oil" and para rubber seed oil, which are capable of replacing linseed oil in some directions. In these cases the natural supply is large, but there is difficulty attending the commercial exploitation owing to high cost of collection and transport; in other cases where the supply is limited, *e.g.*, kernels of stone fruit (plums, prunes, etc.), the extraction of the oil can only be profitably worked as a side issue to some other industry.

Among the marine animal oils our knowledge has been increased of the different species of shark caught in Japanese waters whose liver oils contain highly unsaturated hydrocarbons. The accidental inclusion of a shark liver may explain why the analyst sometimes finds a large amount of unsaponifiable matter in Japanese codliver oils.

A great stride in the commercial synthesis of glycerin has been made by the development of its production by the fermentation of molasses. There is a considerable amount of alcohol produced as a by-product, and as the process is applicable to molasses which are quite inedible there should be a future for it.

MINERAL OIL.

A retrospect of the reaction of petroleum and its products on the European War affords both gratification at the part played by mineral oil chemists in the elucidation of momentous problems and satisfaction that the importance of the chemical investigation of the nature of the raw material is receiving serious attention. When it is realised what progress has been made, for instance, in the unfolding of the chemistry of coal tar, it is somewhat surprising that the nature of the hydrocarbons which occur in petroleum is to a large extent unknown to us. With the exception of the light petroleum fraction and the somewhat sporadic occurrence of solid paraffins, little is known of the vast bulk of the oil, and so far as the writer knows there is scanty evidence that any decisively formulated hydrocarbon has been isolated and its constitution proved by the usual synthetic methods.

The commercial isolation of toluene from petroleum spirit in the form of its mononitro derivative has been a feature of the war. Vast amounts of TNT have been manufactured from this source, and to a large extent this operation has been a deciding factor in the struggle. Investigations in the United States tend to show that the chlorination of natural gas and the lower paraffins will open up an important industry, resulting in the manufacture of carbon tetrachloride, chloroform, acetic esters of the butyl and amyl radicles, and a variety of synthetic products, whilst on the other hand the reactive unsaturated substances which result from the cracking of oils have been shown to contain notable amounts of isoprene and butadiene, and are therefore of potential interest in the rubber industry. It requires little imagination to foresee in petroleum the starting-out material for a great synthetic revival.

Optimistic statements have been made on the important matter of the available quantities of petroleum yet to be exploited. The recent bringing in of highly productive wells in Mexico has called renewed attention to the potentialities of that great producing area, whilst the Persian fields,

at the moment barely "scratched," offer the rosiest possibilities of a great Imperial asset.

The event of the year has been the striking of oil in Derbyshire. Petroleum has long been known to occur in England. The late Sir Boverton Redwood, whose loss is so universally deplored, always insisted on the need for the ultimate test of the drill, and it is perhaps to his persistence in this direction that Lord Cowdray's successful efforts may be traced. The close agreement between the constituents of the Hardstoft oil and those predicted by Mr. J. E. Hackford is an agreeable confirmation of the work that has been carried out on English oil by this observer.

The oil itself is of excellent quality and it resembles a high grade Pennsylvanian oil. High in volatile content, with a residue of first-class lubricating properties, the new crude may turn out to be of prime importance.

Efforts are being made to exploit the native shales, particularly in Norfolk. The first attempts were somewhat discouraging, seeing that the oil possessed high sulphur content, but it is asserted that the shale mined at lower levels yields an oil which is free from this objection. Cannels and other bituminous coals are also likely to be distilled in the near future, and a recently formed combination, the Midland Coal Products Company, proposes to erect a testing station, at which a variety of retorts and retortable material will be investigated.

The past year, therefore, has been one of great promise for the mineral oil industry, and it may fairly be said that a renascence of scientific effort has arrived. For many years the centre of gravity of research in this field had passed into other countries, albeit that mineral oil was first commercially worked in these islands. The munificent gift of the great oil companies to Cambridge University and the establishment of research laboratories in the industry itself are signs that the balance of interest may well return to these shores.

(To be continued.)

THE INTERNATIONAL LABOUR CONFERENCE AND INDUSTRIAL POISONING.

STEPHEN MIALL.

The International Labour Conference, held at Washington in November, 1919, is of some interest to industrial chemists.

The Treaty of Peace with Germany provided that as part of the organisation of the League of Nations there should be an International Labour Office with annual Conferences of four delegates from each country included in the League, of whom two are to be Government representatives, one to represent the employers and one the workpeople. These delegates are accompanied by advisers, and the writer was privileged to attend as an adviser to the employers' delegate from Great Britain, Mr. D. S. Marjoribanks, of the firm of Armstrong, Whitworth and Co., Ltd.

The Treaty of Peace also provided that the first Conference should be held at Washington, and the agenda for that Conference should be (1) the application of the principle of the 8-hour day or the 48-hour week; (2) unemployment; (3) and (4) the employment of women and children in certain respects, including their employment in unhealthy processes; (5) the extension of the Berne Conventions on the employment of women, and the prohibition of the use of white phosphorus. If the Labour Conference comes to a decision on a matter such decision is embodied either in a draft convention or in a draft recommendation, and these drafts are to be forwarded to the Governments concerned, in order that a treaty may be signed, or that appropriate legislation may be introduced, as the case may be.

Delegates from forty countries attended at Washington. The German delegates were invited to attend, and got as far as Rotterdam, where they were delayed until it was too late for them to reach the Conference. The proceedings were conducted in French and English, and were reported in those languages, and also in Spanish. The majority of the delegates and their advisers were well acquainted with the subjects to be discussed, and many of them were experts whose reputation is world-wide. Special Commissions were appointed to consider (a) unemployment, (b) the employment of women and children in unhealthy processes, (c) the employment of women before and after childbirth, (d) the employment of children, and (e) the eight-hour day. These Commissions had protracted sittings, and ultimately their reports were adopted as recommendations by the Conference.

The Commission on the Employment of Women and Children in Unhealthy Processes was presided over by Dr. T. M. Legge, the Senior Medical Inspector of Factories in Great Britain; the Commission included Dr. Glibert, of Belgium, and Monsieur Boulin, of France, both well known as authorities on unhealthy processes. The Commission found that to range over the whole subject of industrial poisoning was impossible, and it confined its attention to plumbism, mercury poisoning and anthrax, recommending that carbonic oxide poisoning should be placed on the agenda for the next Conference, and specially studied meanwhile.

The Conference recommended that women and young persons should not be employed in the following processes:—

(a) Furnace work in the reduction of zinc and lead ores.

(b) Processes in the manipulation, preparation and reduction of ashes containing lead, and the desilverising of lead.

(c) In melting on a large scale lead and old zinc.

(d) In the manufacture of solder and alloys containing more than 10 per cent. of lead.

(e) In the manufacture of litharge, massicot, minium, white lead, orange lead, sulphate, chromate and silicate of lead.

(f) In mixing and pasting of electric accumulators.

(g) In the cleaning of workrooms where the above processes are carried on.

The Conference also recommended that where the employment of women is permitted and there is any risk of plumbism, precaution should be adopted, such as localised ventilation, cleanliness of tools and workrooms, notification and compensation, periodic medical examination, suitable cloak rooms, and special protective clothing, and so forth; and it laid down that where soluble salts of lead could be replaced by those of a non-toxic nature stringent regulations should be enforced where noxious substances continue to be used.

The statistics of plumbism in Great Britain, submitted by Dr. Legge, show a very gratifying reduction in number. Thus:—

The cases of lead poisoning in the smelting of metals declined from 34 in the year 1900 to 15 in 1918; in the white lead industry the cases were 358 in the year 1000, 17 in the year 1917, and no case was reported in the year 1918; in the china and earthenware industry there were 200 cases in 1900, and only 11 in 1918, the reduction being

largely due to the use of fritted lead instead of white lead and red lead; in all the industries included in the returns the cases of plumbism reported were 1058 in 1900, 601 in the average years 1903 to 1905, 381 in 1915, and only 144 in the year 1918. These figures show how much may be accomplished by wise regulations, methodical inspection, and cordial co-operation between the Home Office, the employers and the workers concerned.

The Conference considered that the use of nitrate of mercury by hatters' furriers was unnecessary, and recommends the next Conference to consider its abolition.

The anthrax problem is a difficult one, but progress seems to have been made in the disinfection of wool. The Bradford Committee is of opinion that infected wool is rendered sterile by agitation in warm water with a little soap and sodium carbonate and treatment with a 2½ per cent. solution of formaldehyde in the manner described by it, and the Conference at Washington recommends that international action be taken to ensure the disinfection of suspected wool in the country from which it is infected.

The problems of unemployment and the application of the eight-hour day are complex and a discussion of them would involve a good deal of space. It is hoped that the foregoing very brief account of some of the activities of the International Labour Office will show the importance of its work and the need for all who are interested in industrial progress to study themselves the great problems which surround us so as to be able to help future Conferences to obtain those just and reasonable solutions which the world properly expects.

ARTIFICIAL NITROGENOUS FERTILISERS.

E. J. RUSSELL.

Synthetic nitrogenous fertilisers have been of interest to chemists ever since Sir William Crookes made his famous announcement to the British Association, in 1898, that the world was faced with a serious food shortage unless it could somehow increase its stores of fixed nitrogen. Sir William indicated the solution of the problem, which chemists actively followed up. Synthetic fertilisers were produced in quantity and tested by agriculturists in the field. During the war the subject has been brought into high prominence and great developments have occurred.

There are now three synthetic fertilisers available for agriculture—ammonium nitrate, calcium nitrate, and cyanamide. Of these ammonium nitrate is the most concentrated and probably also the most active, but it is also the most expensive. At the termination of hostilities the belligerent governments had large stocks on their hands which were offered to farmers at low rates; in our own country the price was £25 per ton, packed in barrels. Sulphate of ammonia was at the time being offered at £16 15s. per ton and nitrate of soda at £20 per ton. Worked out as cost per unit of nitrogen (1% per ton—the unit in terms of which the farmer thinks) the prices were 14s. 4d. per unit for nitrogenous nitrate of ammonia, 16s. 9d. as sulphate of ammonia, and 25s. as nitrate of soda. Nitrate of ammonia was therefore much the cheapest, and there was no question as to its value to farmers at this price.

Events have shown, however, that £25 per ton is not an economic price for nitrate of ammonia, and the supply at this price is now exhausted; the Disposal Board is unable to accept further orders from farmers. The question therefore arises, What price is the farmer justified in paying for nitrate of ammonia? Sulphate of ammonia is obtainable at prices advancing from £21 per ton in December to £22 per ton in March, April, and May; nitrate of soda will be offered next spring at £20—£22 per ton according to locality. On the basis of equal unit price nitrate of ammonia should be offered at about £40 to £41 per ton. Chemists have frequently inquired whether nitrate of ammonia has any value over and above that of the mixture of nitrate of soda and sulphate of ammonia to which the unit system equates it. Numerous field experiments have been made; they indicate a slight advantage but no marked superiority of nitrate of ammonia over nitrate of soda and sulphate of ammonia when comparison is made on the basis of equal nitrogen content. Experiments are recorded in this Journal by Hendrick (Vol. 37, 1918, 146R) on hay when nitrate of ammonia gave results up to 4 per cent. better than those obtained from nitrate of soda or sulphate of ammonia. In the Newton Rigg experiments, on the other hand, the nitrate of ammonia was less effective than nitrate of soda; the results were:—

	Yield per acre. 1913. Tons.	1914. Tons.
Nitrate of soda	20¾	23¼
Nitrate of ammonia	14¼	21¼

The low result of 1913 is difficult to understand and is not typical of results usually obtained. The Rothamsted experiments conducted during the season of 1918 with nitrate of ammonia supplied by the Ministry of Munitions gave the following results:—

Stackyard Field, Mangolds. 1918.

Seed sown May 29; Roots carted December 9 to 12.

Manure.	Weight of mangolds. Per plot (1/20 acre).	Per acre (mean of two plots).
	Cwts. qr. lb.	Tons.
Superphosphate, salt and sulphate of ammonia.	19 1 8	18·6
	17 3 20	
Superphosphate, salt and nitrate of ammonia.	20 2 20	23·3
	25 3 18	
Superphosphate and salt	16 2 20	17·3
	17 3 16	

Manuring:—

All plots received a dressing of dung at the rate of 10 tons to the acre.

The other manures at rate of—

Superphosphate	4 cwts.	per acre
Salt	2 "	"
Sulphate of ammonia	2 "	"
Nitrate of ammonia	145 lb.	" (equivalent to 2 cwts. sulphate of ammonia).

West Barnfield: Potatoes. 1918.

Variety "Arran Chief," planted May 9; 27 rows in each plot of 1/20 acre.

Plot.	Manure.	Tubers roughly cleaned. Weight per acre.	Mean per acre.
		Cwts.	Cwts.
9	Superphosphate & sulphate of ammonia	175·4	175·4
11	Superphosphate and nitrate of ammonia	178·9	174·5
14		170·0	
13	Superphosphate alone	146·8	160·9
10		175·0	
15	No artificials	144·3	144·3

A dressing of dung was applied over the whole field in the winter, and ploughed December 10 to January 3.

Rates per acre of artificial manures:—

Superphosphate	4 cwts.
Sulphate of ammonia	2 ,,
Nitrate of ammonia	145 lb.

Little Hoos Field: Wheat. 1918.

Variety, "Red Standard" (after clover).
Seed sown, November 3 to 5, 1917.
Crop cut, August 12 and 13, 1918.
Artificial manures applied, April 26, 1918 (by hand), consisting of:—
2 cwts. superphosphate per acre, or
1 cwt. sulphate of ammonia per acre, or 72¼ lb. nitrate of ammonia per acre (these contain equal quantities of nitrogen).

	Dressed grain per acre.	Straw per acre.	Total produce per acre.
Experiment I.	lb. bush.	lb.	lb.
Unmanured	2,195 33·9	4,030	6,443
Superphosphate only	2,492 38·6	4,550	7,310
Sulphate of ammonia and superphosphate	2,630 41·3	5,250	8,178
Nitrate of ammonia and superphosphate	2,822 44·7	5,070	8,120
Experiment II.			
Unmanured	2,325 35·8	4,450	7,057
Superphosphate only	2,198 34·6	4,520	7,025
Sulphate of ammonia and superphosphate	2,585 40·1	4,830	7,775
Nitrate of ammonia and superphosphate	2,400 37·7	5,050	7,830

On the other hand, nitrate of ammonia has some disadvantages in comparison with nitrate of soda; it is not so easily handled by the farmer; it has to be stored in casks, not in bags, and it is not readily applied by the ordinary drill. These are essentially minor disadvantages, but they off-set any slight advantage the nitrate of ammonia may possess over nitrate of soda, and probably no farmer would purchase it if he could obtain nitrate of soda at the same unit price. So long as nitrate of soda is obtainable at £20 per ton farmers are not likely to purchase nitrate of ammonia unless it could be obtained at about £35 per ton, or less.

Calcium nitrate.—This substance is now manufactured on a large scale and is producible at prices comparable with that of nitrate of soda. Further, it is already fairly well known to agriculturists; it is in charge of a competent propagandist agent and is a really useful fertiliser. Experiments designed to compare it with nitrate of soda are recorded in this Journal for March 15, 1917 (Vol. 36, pp. 250—261), and in Vol. 37, 1918 (p. 146 R), and no important difference has been discovered. The percentage of nitrogen differs, nitrate of soda containing 15·5% and nitrate of lime only 13%, corresponding to 76·2% pure calcium nitrate, the rest being mainly water with traces of calcium oxide, carbonate, etc. This is in favour of nitrate of soda. On the other hand, nitrate of lime has the advantage that the calcium is never hurtful in the soil, while the sodium sometimes is, though also the sodium is sometimes an advantage. On the whole, farmers would probably be willing to pay nearly as much per unit for nitrate of lime; and, assuming that nitrate of soda were available at £20 per ton, they would probably pay up to £16 or £16 10s. per ton, though, of course they would purchase more freely at a lower price.

Cyanamide.—Cyanamide presents the characteristic that it is not at once available for plants, but has to undergo change in the soil whereby ammonia is formed, which subsequently nitrifies. The whole value of the material, therefore, depends on the rate at which this change proceeds. In some soils it goes on rapidly, and here cyanamide is very effective. In others, however, it proceeds more slowly. It is a first essential that the change should be fully investigated, so that it can be fully understood; there is reason to suppose that the production of ammonia takes place in two stages, the first of which is purely chemical and the second bacterial; further, that the agent producing the chemical change is not always present in sufficient quantity in the soil. It would be an obvious advantage if a chemist could say beforehand of a given class of soil whether or not it were likely to decompose cyanamide. Work with this purpose has been carried out at Rothamsted, and the results are very promising.

The results of all published field trials show that the three fertilisers—nitrate of soda, sulphate of ammonia, and cyanamide—when compared on the basis of equal nitrogen content have the following values:—

Nitric nitrogen	100
Ammoniacal nitrogen	97
Cyanamide nitrogen	90

But these include cases where the cyanamide nitrogen could have had no proper chance of acting. Under better advice, such as is now obtainable, the farmer could have been warned beforehand, and the use of the cyanamide kept to those numerous cases where it can decompose rapidly and act well. In these circumstances the value of the cyanamide nitrogen might rise well above 90, and, what is more important, the risk of failure might be considerably reduced. Under present conditions farmers would be unlikely to pay more than about £18 or perhaps less per ton for cyanamide containing 20% nitrogen if sulphate of ammonia were obtainable at £21. When the decomposition is better understood, however, experts will be in a position to advise more confidently; the fault lies less in the material than in our uncertain knowledge of some of the fundamental points.

On the other hand, the makers must obviate the presence in the commercial article of dicyanodiamide, which is actually harmful to vegetation. This is a factory problem, but chemists will not readily believe it to be insoluble.

REVIEW OF THE SPELTER SITUATION.

H. M. RIDGE.

In 1913 the world's spelter production amounted to 982,000 tons, of which 32 per cent. was made in the United States, 28 per cent. in Germany and 20 per cent. in Belgium; in Great Britain only 6 per cent. was made, although the consumption amounted to 23 per cent. of the metal produced in the whole world, while in the whole of the rest of the Empire only 3700 tons was produced. As a consequence an acute shortage of metal was experienced during the war and prices rose phenomenally. Schemes were prepared for increasing the output, but with the whole of the smelting capacity of the United Kingdom in operation only 80,000 to 85,000 tons could now be produced annually.

During 1919 the world's production amounted to about 520,000 tons, including 410,000 tons in the United States, but only about 20,000 tons in Great Britain, where the output has been limited by shortage of ore and by labour troubles. Belgium only recommenced smelting towards the middle of the year, and was hindered by shortage of ore and

the difficulty of securing sufficient shipping tonnage even at high prices. During 1919 British imports of spelter amounted to 94,226 tons.

At the present time production is progressing satisfactorily in America, but Belgium is producing only 6500 tons a month or 39 per cent. of the pre-war output, and Germany 3500 tons or 14 per cent., and Great Britain 2000 tons or 40 per cent. It is obvious that until conditions improve we are dependent on American supplies. Owing to the necessity of preference being given to the shipment of foodstuffs, wool and other essential commodities, zinc ore is being shut out, and there seems no prospect of the British or Belgian works being able to run their furnaces at full capacity during the coming months, but even then the output in the United Kingdom will be limited by the amount of plant available. If we are to become independent of foreign supplies of spelter the extension of existing plants and the erection of new works are necessary.

During the war zinc smelting was classified as one of the important key industries, but no steps have yet been taken to make the country self-supporting, although ample supplies of ore are available within the Empire.

For the ten years before the war the average price of g.o.b. spelter in London was £23 16s. 5d. Since then the average prices have been:—

1914	£23	6	8
1915	£66	13	8
1916	£68	18	11
1917	£52	3	6
1918	£52	4	0
1919	£42	9	3

On the technical side important improvements have been made in recent years. Ordinary wet methods for the concentration of zinc ore have been superseded by the flotation process, electro-magnetic separation being now used only quite exceptionally. Flotation has necessitated finer crushing, but it has been found that higher recoveries are obtained, while the grade of the concentrate is improved owing to more complete elimination of the gangue.

In the treatment of zinc concentrates no radically new methods have yet proved suitable. Electrolytic precipitation has been tried in a number of works in the country, but all of these have been shut down, including the Hoepfner process plant at Winnington, from which such a good product was obtained for several years. It is interesting to note that at the same time electrolysis has been adopted for the new plants in Tasmania, Canada and at one works in the United States, but in each of these cheap power is available. The demand for high-grade zinc will be large in future, but it can now be obtained cheaply by new means which were worked out during the war. Much progress has been made with the electric furnace reduction in Norway, Sweden and France, and the troubles experienced in the condensation of the zinc vapour have been largely overcome, but here also cheap power is essential.

Hand-rabbled furnaces for roasting are rapidly being replaced by mechanical furnaces, and these are already satisfactorily in operation in several works in the country. The saving in labour is important, and at the same time a more regular product is obtained and the consumption of coal decreased. The even supply of sulphur fumes materially facilitates the working of sulphuric acid plant, and avoids the losses of nitre which take place when hand furnaces have to be worked intermittently.

Pot-making machinery was in the past obtained from Germany, but during the war complete plant for this purpose was designed and manufactured here, and has given entire satisfaction. Novel apparatus for more efficiently mixing the different clays has proved successful. Clay for pot-making used to be imported from Belgium, Germany and Austria, but the war stimulated experiments with British clays, and these can be used as well as the imported materials, giving a good pot life when working at a high temperature. After drying and burning the red-hot pots have to be taken to the furnace and put into place. Even in this arduous operation hand labour is replaced by a simple semi-automatic apparatus, and a good deal of delay to the furnace is being saved by this means.

The results obtained with improvements in the design and construction of the zinc distilling furnaces are worth recording. To reduce 10 tons of ore 14½ to 15 tons of coal was formerly required for heating. In a plant built during the war the coal consumption has been reduced to under 8 tons, a figure which constitutes a world's record. The furnaces are built with counter-current recuperators, and there are no reversing valves requiring attention; the heat in the waste gases is so efficiently utilised to preheat the air that the temperature of the gas going to the chimney stack is reduced very much below what was formerly considered possible.

Weighing, mixing and transportation of the charge to the furnaces is now done entirely mechanically, so that much labour is saved and supervision facilitated.

Charging the pots in the furnace probably used to be the most laborious work of the zinc smelter, and this has been overcome with the aid of charging machines. These are driven electrically, and are much more efficient than hand charging, the pots being more uniformly charged and the charge denser. The duration of the manœuvre is shortened by about two hours, and the time for working off the charge is increased correspondingly, because 14 tons of charge can be fed into the pots in less than twenty minutes.

The more extensive use of machinery reduces the number of men, and at the same time makes the management more independent of the skilled workmen.

The outlook for the zinc industry in Great Britain is not promising unless the existing works can be brought up to date and the smelting capacity increased by the construction of additional works. New plant built during the war has demonstrated that zinc smelting can be carried on efficiently, economically and profitably provided that the best designs and apparatus are adopted, and in view of the large demand for metal in the Empire it is to be hoped that means will be found so that it will become unnecessary to rely upon imports from foreign countries.

SODIUM AND SODIUM COMPOUNDS IN 1918.

A report recently issued by the United States Geological Survey (Mineral Resources of the United States, 1918, Part II., Pp. 198) contains many statistical tables dealing with the production, exportation and importation of all the important commercial sodium compounds, together with analyses of natural products, information concerning uses and manufacturing processes, and in some cases the names of manufacturers. The data supplied relate mainly to the American products, but some particulars of production etc. in other countries are also included. The report also contains a bibliography dealing with natural sodium salts.

The total quantity of sodium salts derived from natural sources amounted to 6,999,920 short tons, valued at $20,836,044 in 1917, and to 7,262,797 short tons, worth $27,933,149, in 1918. The imports of sodium salts during 1917 were 3,601,655,180 lb.,

valued at $62,527,007, and 4,223,449,559 lb., valued at $90,939,431, in 1918. Of these imports by far the greater part was sodium nitrate, of which 3,456,780,000 lb. ($60,727,100) was imported in 1917, and 4,138,758,400 lb. ($90,216,935) in 1918. The domestic exports of sodium salts were valued at $1,320,963 in 1914 (July 1 to December 31), at $7,725,034 in 1915, at $17,571,439 in 1916, at $23,384,969 in 1917, and at $22,291,735 in 1918. In 1915 foreign sodium salts were re-exported to the value of $40,358, and during succeeding years to the respective values $193,086, $25,632, $73,402. It is considered probable that pre-war prices for potassium compounds will not be reached for a very considerable time, and it is anticipated that most of the substitutions of potassium salts by sodium salts which have occurred under the stress of war conditions will be permanent. The principal producers of alkali in the United States have organised an Export Association, with offices at 171, Madison Avenue, New York City, which aims at securing uniform and favourable conditions in the export trade, especially in regard to foreign banking facilities and ocean freight rates.

Production of sodium and sodium compounds in the United States during 1917 *and* 1918.

	1917. Quantity (short tons).	1918. Quantity (short tons).
Sodium (metal) *	—	264
Sodium acetate	1,049	2,622
Sodium benzoate	—	203
Sodium bicarbonate	119,177	118,535
Sodium bichromate and chromate	22,446	28,334
Sodium bisulphite and sulphite	13,707	16,362
Sodium bromide	—	574
Sodium carbonate:		
Soda ash	1,390,625	1,390,628
Monohydrate and sesquicarbonate	55,035	22,078
Washing soda	77,930	82,465
Sodium chlorate and perborate	2,915	2,413
Sodium chloride:		
Salt in brine	2,830,588	2,830,600
Rock salt	1,605,025	1,683,941
Evaporated salt	2,482,564	2,724,203
Sodium cyanide, iodide and peroxide	9,694	9,086
Sodium ferrocyanide	4,173	4,525
Sodium fluoride, acid fluoride and fluosilicate	1,424	1,228
Sodium hydroxide	488,056	513,363
Sodium nitrite	861	1,701
Sodium phosphate (all)	13,305	15,620
Sodium silicate	254,011	317,161
Sodium sulphate:		
Salt cake	183,909	141,054
Glauber's salt	47,757	50,715
Nitre cake	387,821	143,155
Sodium sulphide	49,494	43,490
Sodium tetraborate (borax)	32,089	26,673
Sodium thiosuphate	26,598	26,868
Miscellaneous sodium compoumds	4,563	381
Total	10,164,825	10,198,842

* The output of sodium metal for 1917 is included in that of miscellaneous sodium compounds.

With regard to individual products it is noted that sodium bichromate has come into extensive use in the tanning industry within recent years in place of potassium bichromate, and has been found equally efficient. The manufacture of soda ash is confined almost entirely to the States of New York, Ohio, Virginia, Michigan, California and Kansas. Of nine companies manufacturing soda ash, five utilise salt brine, three have deposits of natural salt and one company incinerates the ash from spent pulp liquor. Soda ash manufactured by the ammonia soda process is of exceptional purity, running 99·0—99·7% of sodium carbonate, and that made from cryolite is stated to be very pure. A number of pulp and paper mills, employing the soda process of making fibre, recovers sodium carbonate from the spent liquor, effecting a saving of from 80—90 per cent. of the soda ash required. The Hargreaves-Bird process of making sodium carbonate by the electrolysis of salt solution, the cathode solution being carbonated, is employed by at least three firms. The natural deposits of soda in the Western States have been worked commercially in a number of places, and methods of extracting the potassium salts from the deposits are being elaborated. Favourable conditions for the production of sodium carbonate exist in the case of the waters at Owens Lake. The lake water is merely evaporated in open vats until a deposit of trona is formed. A large number of patents has been issued in recent years for the separation and utilisation of the several salts occurring in the natural deposits of soda.

Sodium chlorate has supplanted potassium chlorate to a considerable extent in medicine, and is employed in the manufacture of dyes, matches, and high explosives. The practice of returning the cyanogen content of cyanides in terms of equivalent potassium cyanide results in very impure sodium cyanide being sold as 97—98% potassium cyanide, but recently the sodium compound has been sold on its actual sodium cyanide content, the highest grade being 96—98% sodium cyanide equivalent to 51—52% cyanogen. The Bucher process for cyanide production from soda ash, powdered coke, iron ore and air is now under investigation by Government agencies. Restriction of imports imposed by war conditions has resulted in the greatly-increased domestic production of sodium ferrocyanide, which now largely supplants the potassium salt. All domestic requirements can now be met by home supplies.

Proposals for the erection of plant for the manufacture of caustic soda, in order to meet foreign demands, are numerous. The Brunner, Mond, Company's plant at Amherstburg, Ont., has already been referred to in these columns (J., 1919, 85 R, 435 R). Plants for the electrolytic production of caustic soda are in course of erection in Peru, Brazil, China and Japan. The Brazilian Government offers pecuniary assistance to the three firms first commencing operations. The Loewig process of making caustic soda consists in heating soda ash with ferric oxide, whereby sodium ferrite and carbon dioxide are formed. The ferrite is decomposed by water, yielding a concentrated solution of sodium hydroxide, and iron oxide, which is used over again. Many samples of nitrate-bearing material have been examined, but the results do not foreshadow the possibility of successful commercial exploitation. Sodium permanganate is made by the electrolytic oxidation of sodium manganate, and has largely supplanted potassium permanganate in use. The output of sodium phosphate was 2,340 short tons in 1899, 12,290 tons in 1909, 15,387 tons in 1914, and 13,305 and 15,620 tons, respectively, in 1917 and 1918.

Experiments have shown that superphosphates containing 15 per cent. of available P_2O_5 can be readily produced from Florida pebble phosphate by grinding and mixing with nitre cake, the application of heat being unnecessary. Nitre cake in a friable form can be made by adding sodium carbonate or any substance that evolves a gas to melted nitre cake. The application of natural sodium sulphate in an increasing number of directions is recommended. Experimental work has been carried out on the production of anhydrous sodium sulphate from the deposits of natural sulphate near Valmont, New Mexico, and commodity rates have been granted to shipments of the product.

Crude natural borax (tincal) occurs in San Bernardino County, Cal., in saline lakes and playas in Nevada, Oregon, and in the hot springs of Yellowstone Park. Borax is manufactured from the mineral colemanite ($Ca_2B_6O_{11}.5H_2O$) by treatment with sodium carbonate. The American Trona Cor-

poration contemplates the production of from 20—30 tons of refined borax daily from the water of Searles Lake, and it is understood that production from this source is now under way. New deposits of boron ores have been located at Muroc, Kern County, Cal. No borax is now imported into the United States, and the quantity of boric acid imported during 1918 was the smallest for many years, with the exception of 1912. Deposits of boron ores are being actively worked in Chile, Argentina, Bolivia, Peru, Germany, Italy, Turkey, Russia and Tibet.

NEWS FROM THE SECTIONS.

CANADIAN PACIFIC.

The first meeting of the session was held on October 28 at the University Club of Vancouver. During the afternoon the new Laboratories of the Dominion Department of Health were open to visiting members. After the customary dinner, a business meeting was held when matters concerning the organisation of the Society in Canada were discussed.

The November meeting was held in the same place on the 27th. In the afternoon, at the Convention of the Canadian Mining Institute, Mr. Horace Freeman, a member of the local Section, read a paper on "New Methods in the Hydrometallurgy of Gold and Silver." The manufacture of sodium cyanide from calcium cyanamide by the process patented by Mr. Freeman was referred to and the superior advantages of the product emphasised. Mr. Freeman then reported his recent discovery of the use of a metallic sodium-lead alloy to replace zinc dust in precipitating gold and silver from cyanide solutions. By the action of this alloy the sodium cyanide solution is regenerated, while the presence of the lead facilitates the recovery and refining of the precious metals.

During the evening the members had the pleasure of a very instructive discussion with Dr. A. B. Macallum, Chairman of the Advisory Council for Scientific and Industrial Research of Canada. Dr. Macallum described the successful and progressive work resulting from the establishment of the Council and referred to the proposed legislation for a National Research Institute for Canada, which among other functions would assist the organisation of Trade Guilds for Research among the industries. Much interest was evinced in the announcement that the Council proposed to investigate a number of local problems, especially the utilisation of the great quantities of wood and fish waste, and of the production of iron and steel from British Columbian ores.

BIRMINGHAM.

Mr. L. P. Wilson presided at the meeting held at the University Buildings, Edmund Street, on December 11, and extended a cordial welcome to Prof. G. T. Morgan, who has succeeded Prof. P. F. Frankland in the chair of chemistry at the University.

Mr. James O'Sullivan read a paper "On the Influence of the Temperature, Concentration, Duration of Mash, and Slackness of Malt on the Starch Products of the Extract of Malt." Experiments proved that cane sugar is not inverted in the process of mashing, and that invertase is not present in malt. The absence of invertase, also of lipase, made the way clear for determining the influence of varied conditions of washing on the starch transformation products of malt. The author gave the results of a series of experiments with "thick" and "thin" wash at varying temperatures. From parallel experiments with "dry" malt containing 3·9 per cent. moisture and a "slack" malt containing 10·7 per cent. moisture, the author had little doubt that the difference between the extracts was due to the fact that the "slack" malt did not grind as finely, under like conditions, as the "dry" malt.

A paper on "The Erosion of Lead," by Messrs. J. F. Liversedge and A. W. Knapp, was read by Mr. Knapp. The erosion test with which the paper dealt was devised by Dr. Houston. The experiments were made with Birmingham water, a faintly alkaline natural water which dissolves very little lead, but which has, in the untreated condition, the power of eroding lead, so that scales forming on it fall away and leave a fresh bright surface open to attack. Experiments were made to investigate the effect of light, volume of water, area of water exposed to air, bacteria, exposure to glass, and of dissolved gases, liquids, and solids. The authors conclude that erosion is due to the action of oxygen in the presence of water, and occurs readily in waters containing no carbon dioxide. Such variations as occurred naturally in the percentage of oxygen or carbon dioxide had no appreciable effect on the erosion, but the presence of from 1 to 2 per cent. of carbon dioxide cause a sudden change from "erosion" to "plumbo-solvency." Calcium carbonate is the most effective preventive of erosion, as little as 2 parts per 100,000 being generally sufficient to inhibit it.

GLASGOW.

The Glasgow Section held a joint meeting with the local section of the Institute of Metals on December 16 in the Royal Technical College. Prof. C. H. Desch was in the chair.

Mr. Greer and Mr. Langlands congratulated the chairman on his recent appointment to the chair of metallurgy in Sheffield University. Mr. J. A. Gardiner then read a paper on "The Solidity, or otherwise, of Gunmetal Castings."

The paper was a judicious admixture of theory and practice, and due credit was given to the art and craft of the practical moulder. Although in the present stage of foundry evolution the technical worker lacks the experience that the older foremen possess, the time is not far distant when the value of science will be fully recognised and its dictates put into practice. Cores, vents, gates, and risers each have an effect on the solidity or otherwise of the alloy. With regard to impurities, aluminium, bismuth, and manganese are bad; arsenic in small quantities and lead up to 2 per cent. are not objectionable; phosphorus gives fluidity to gunmetal, but its constant return in the scrap and borings makes it undesirable. Bad gating gives improper feeding to the casting and its effects are "drawn" holes due to liquid metal shrinkage, pocketed air holes, and the working into the casting of portions of the moulding sand. By judicious gating the cooling effects on thick and thin sections of a casting can be controlled. In summing up, a questionable metal can be more readily made to give solidity by judicious moulding than a good metal in the hands of a questionable moulder.

A dinner was held in the St. Enoch Hotel, on December 18, to enable the members to meet Mr. John Gray and Dr. Longstaff, who had come North to visit the Scottish Sections. In an informal talk with the members the progress of the Society in the past and ways and means of increasing its usefulness in the future were discussed. Mr. Moore (the chairman) thanked the President and Dr. Longstaff for their presence, and assured them of the active co-operation of the Section.

NEWCASTLE.

At a meeting held on December 17, at Armstrong College, the chairman, Prof. P. P. Bedson, announced that the Council had accepted the invitation of the Section to hold the next Annual Meeting in Newcastle, at some date in July. He also proposed a vote of thanks to the Newcastle Gas Co. and the Bede Metal Works Co. for allowing parties of members to visit these works, and this was carried.

The main item on the agenda was an address by Dr. J. H. Paterson on "The Theory of Gas Producer Reactions, with special reference to the rate of gasification." In explaining the elementary principles of gas producers, the author expressed his dissatisfaction with some of the assumptions made in text-books, *e.g.*, that there are separate zones of oxidation and reduction in a gas producer, and that carbon monoxide is not the first product of the reaction between the carbon and the air. From the standpoint of economy, a gas producer burning fuel at high rates, say, 50—100 lb. per sq. ft. of grate area per hour, was preferable to a low duty producer in that the capital cost of the plant was less and the upkeep and labour cost lower. The former kind must of necessity be supplied with fuel of low ash content, and the problem of eliminating or reducing ash was a very urgent on , which should be dealt with at the colliery rather than at the furnace. Dr. Paterson then described a very compact, high duty producer, designed by Col. J. D. Smith, which had been used successfully for the propulsion of motor lorries. It was worked on the suction principle with a high rate of fuel consumption, from 80 to 90 lb. per square foot per hour, was entirely automatic in action, and had a flat bar grate of the shaking type, which had proved efficient under trial. There was an extremely shallow fire bed, sometimes as low as two inches thick, and the designer claimed that when using bituminous coal the distillation zone disappeared entirely, and a nearly tar-free gas was produced. The opinion was expressed that this type of producer would come into general use. A good discussion followed the address, and Dr. Paterson announced his intention of writing a lengthy paper on the subject.

LIVERPOOL.

A meeting of the Section was held at the Adelphi Hotel on December 19 last, with Dr. Armstrong in the chair.

Mr. R. Thomas contributed a paper on "The Mechanism of the addition of Hydrogen to Unsaturated Glycerides in the Presence of Finely Divided Nickel." The first portion of the paper dealt with the mechanism of the addition of hydrogen to unsaturated glycerides. The author pointed out that the use of finely reduced nickel as a catalyst in chemical reactions involving the addition of hydrogen to unsaturated compounds was first established by Sabatier and Senderens in 1897, but that none of the numerous investigations then or since dealt with the subject from the dynamical standpoint, although the velocity of the reaction was a most important consideration for manufacturers. He showed certain equations derived for the rate of the addition of hydrogen to mixtures of unsaturated glycerides, using nickel as a catalyst. He considered that the reaction between pure hydrogen, maintained at a constant pressure, and an unsaturated glyceride was of the first order. The more highly unsaturated glyceride (linolin) took up hydrogen at a much greater rate than olein. Using olive oil as the starting point in his investigations, as it was the nearest approach to a chemical entity among vegetable or animal oils, he found that the addition of hydrogen at constant pressure gave a unimolecular reaction, and he showed that the agreement between the observed values of the hydrogen absorption and those calculated from the equations justified this assumption. In Part 2 of his paper, the author discussed the function of the catalyst, its action being attributed by Sabatier to the alternate formation and decomposition of an unstable nickel hydride, while Armstrong and Hilditch compared the action of nickel in fat hardening to that of an enzyme in the hydrolysis of glucosides. He described the results of experiments on the influence of the pressure of hydrogen, and of temperature, on the velocity of the reaction, and showed that the rate of saturation of olein (containing three double bonds) was proportional to $p^{1\cdot5}$, where p is the pressure of the hydrogen. This agrees with the view that the hydrogen becomes active through its absorption by the catalyst—Sieverts having shown that such absorption is proportional to p—with a dissociation of the hydrogen molecules into atoms. The temperature coefficient of the velocity was found to be small, thus suggesting a photochemical reaction, the molecules of olein being brought into an active condition by the absorption of infra-red radiation emitted by the catalyst.

In Part 3 Mr. Thomas dealt with the influence of foreign gases on the catalyst and on the velocity of hydrogenation. He pointed out that the mode of action of gaseous catalyst poisons may be a purely physical one, or it may be chemical in that the poison is capable of reacting either with or in the presence of the catalyst. He described three experiments which were conducted with hydrogen containing (A) nitrogen, as typical of gases which undergo no chemical action with or under the influence either of the catalyst, glyceride, or hydrogen; (B) carbon monoxide, as typical of gases which undergo a transformation with hydrogen in the presence of the catalyst; and (C) hydrogen sulphide, as typical of gases which unite with the catalyst.

LONDON.

A meeting of this Section was held on January 5 at Burlington House, Mr. Julian L. Baker being in the chair. Mr. E. V. Evans and Dr. G. S. Walpole, who have recently returned from tours in Germany, took as the subject of their addresses the present position of chemical industries in that country.

The first speaker, Mr. Evans, who was chairman of the British Mission to German Chemical Works, drew a vivid picture of the great Rhineland organisation as it appeared at the time of the visit. He depicted a huge organisation consisting of many factories, efficiently and lavishly fitted with plant in excellent repair, yet temporarily paralysed owing to the need of raw material and the requisite labour. Particular attention was drawn to the favourable geographic and economic situation of the chemical works in the Rhine valley, and to the advantages accruing to the industry owing to the fact that it has received the support of the nation, the Government, the banks and the universities. The factors which were thought to attribute essentially to the past supremacy of the industry received consideration, the speaker laying stress on the fact that the results obtained were not due to witchcraft, but to collaboration between chemist, physicist, engineer, and commercial director. He emphasised the valuable part played by engineering in the industry, and by scientific method in the organisation of the undertakings. The success attained by the organic chemical industry in Germany was the result of the combined effort of 40 years or more, whilst in this country only the last few years had been seriously devoted to this work, which even then had been carried out under the retarding influence of war conditions. The speaker

emphasised the necessity for immediate Government protection, in view of the fact that there existed in Germany an organisation capable of producing almost the whole of the world's pre-war requirements in dyestuffs, whilst at the same time, America, Switzerland and France were making a determined effort not only to supply their own requirements in these organic products, but also to create an export trade.

Dr. Walpole next addressed the meeting on "The Collective Effort of German Chemical Industry." He considered that the fundamental distinction between the situation in Germany and this country was the striking superiority of what may be called the "staff work" of the German industry. He remarked upon the curious paradox that the English, who in sport "play for their side" should in business exhibit such an invincible bias towards individual effort, whereas the German with his deficient sporting instinct always favoured, in business, a highly developed system of combination of interests. The essential factor of German success in chemical industry was the policy of united effort which took cognisance of, and extended its control to every detail. The consequence of this highly elaborated co-operation of interests was the abolition of useless competition amongst its component parts, while the Government on its side offered every inducement to municipal bodies, railways, inland revenue authorities, harbour trusts and so forth, to frame their regulations in accordance with the needs of chemical industry. Dr. Walpole then sketched the system underlying the training of the great body of chemical workers in Germany, and showed how such training is arranged for them by the very industries which were ultimately to reap the reward of their expert services. Stress was also laid on the fact that chemical plant, which in this country is so often the product of unspecialised and unskilful improvisation, is in Germany the speciality of numerous engineers who have devoted their whole attention to the manufacture of plant minutely adapted to specific ends. Machinery of this nature was not purchased haphazard with a view to secure some temporary gain, but as part of a co-operative policy previously thought out with care and thoroughness which took the world market as its main consideration.

MEETINGS OF OTHER SOCIETIES.

SOCIETY OF GLASS TECHNOLOGY.

On December 17, at the Institute of Chemistry, London, the President, Mr. S. M. Jenkinson, presented on behalf of the members testimonials to Mr. W. F. J. Wood, the first president of the society, and to Dr. W. E. S. Turner, the secretary, in token of appreciation for the work they had done in founding the society and in bringing it to its present position of influence. Part of the testimonial to the former took the form of a cheque, which the recipient had decided to invest and to devote the interest to the foundation of an annual prize to be awarded to a student in the Department of Glass Technology of the University of Sheffield.

The paper on "The Glass Industry of North America," announced to be read by Dr. Turner, was distributed in proof as the author was unable to read it on account of illness. Notes dealing with the same subject were contributed by Mr. J. Connolly, Dr. M. W. Travers and Mr. W. F. J. Wood, each of whom had recently returned from a tour in the States. The chief points dealt with by the speakers were: Raw materials for glass making, batch mixing; glass-melting furnaces and producers; annealing; pyrometric control; bottle and jar manufacture; electric light bulb manufacture; chemical and scientific glassware, optical glass, glass rod and tubing; chemical and optical glass; and refractory materials. Great stress was laid by all speakers on the development of the use of automatic and semi-automatic machinery in glass manufacturing in America and the consequent increase and economy in production. A large number of specimens of glassware, raw materials, etc., illustrative of American conditions and workmanship was on view prior to the meeting and aroused considerable interest, as did also a dividing machine shown by Messrs. Munro.

PERSONALIA.

Mr. Frank Merricks has been elected president of the Institution of Mining and Metallurgy for the present year.

Dr. F. W. Keeble has been elected to the Sherardian professorship of botany in the University of Oxford.

Sir Richard Glazebrook has been appointed to the Zaharoff chair of aviation at the Imperial College of Science and Technology.

At Leeds University the chair of mining has been filled by the appointment of Mr. Granville Podle, who has been an inspector of mines under the Government.

Prof. H. G. Greenish, Professor of Pharmaceutics to the Pharmaceutical Society of Great Britain, has received from the University of Paris the degree of doctor, *honoris causa*.

Dr. E. Ardern has resigned the post of chief chemist to the Rivers Committee of the Manchester Corporation and has accepted that of consulting chemist to the same body.

Dr. F. Paneth, who formerly worked on radioactivity in the laboratories of Prof. F. Soddy at Glasgow, and Sir E. Rutherford, at Manchester, has been appointed professor of chemistry in the University of Hamburg.

Prof. R. Robinson, lately professor of organic chemistry in the University of Liverpool, has taken up his duties at Huddersfield as director of research in the dyestuffs department of British Dyestuffs Corporation, Ltd. (Huddersfield).

Dr. S. R. Wells has succeeded Sir Cooper Perry, now Principal Officer, as Vice-Chancellor of London University; and Mr. C. Grant Robertson, of Magdalen College, Oxford, has been appointed Principal of Birmingham University, in succession to Sir Oliver Lodge.

The first list of New Year Honours, published on January 1, includes the following: Peerage of the United Kingdom: Sir Albert Stanley, late President of the Board of Trade. Order of the Bath, K.C.B.: Sir Richard T. Glazebrook, late director of the National Physical Laboratory. Baronetcy: Mr. A. F. Bird, a director of Alfred Bird and Sons, Ltd.; Mr. J. T. Cargill, chairman of the Burmah Oil Company; Col. J. Roper Wright, chairman of Baldwin's, Ltd. Knighthood: Col. W. A. Churchman, Ministry of Munitions, Explosives Department; Mr. F. G. Ogilvie, assistant controller in Trench Warfare Research Department, Chemical Warfare Department; Prof. A. Schuster, late secretary of the Royal Society.

NEWS AND NOTES.

SOUTH AFRICA.

Industrial Notes.—*Manufacture of sheet lead.*—A Capetown firm has completed the erection of a plant for the manufacture of sheet lead, which it is understood is competing successfully with the imported article. Besides sheet lead this firm is turning out lead pipe, solder, and other articles.

South African Sugar Association.—After negotiations extending over a period of two and a-half years an amalgamation of the sugar planters' and millowners' organisations has been accomplished, resulting in the formation of the South African Sugar Association. The view of both sections is that this amalgamation of interests should be of the utmost value to the industry.

Annual Mining Exhibition.—The Chemical, Metallurgical and Mining Society of South Africa has arranged for the resumption of the annual mining exhibitions, which were discontinued during the war. It is proposed to hold the next exhibition in January, 1920, but as it will not be possible to arrange for this exhibition to be on the same scale as in former years, it is intended that on this occasion it will be primarily for exhibiting the many devices and materials manufactured locally on or for the mines during the war as substitutes in place of supplies usually imported.—(*S. Afr. J. Ind., Oct.*, 1919.)

Pretoria Iron Works.—An "African World" cable announces that these works are being reconstructed by the National Industrial Corporation, which is associated with the National Bank of South Africa. The Bank has underwritten £1,500,000 for working capital.

AUSTRALIA.

Manufacture of High-Grade Steel in Western Australia.—A company known as the "Australian Electric Steel Limited," of Sydney, is about to establish works at Guildford, Western Australia, for the manufacture of high-grade steels, such as chrome and manganese. This company was formed in 1916 and established works at Alexandria, New South Wales, where it has met with considerable success. Its capital has been increased from £40,000 to £160,000, and employment has been found for a considerable number of operators. It is estimated that the output of the Western Australian factory will be about £50,000 worth of steel of different grades, special attention being given to the production of high-grade manganese steel as used in mining. The company is one of the largest consumers of electric current supplied from the Government power plant at East Perth, and it has purchased about 15,000 tons of scrap metal from the Government Railway Workshops.

Up to the present the company has been able to carry on successfully with the assistance of the protection afforded by war conditions. But with the resumption of normal trade conditions it is stated that it will be necessary to remove some of the tariff anomalies at present existing, *e.g.*, on ordinary steel casting there is a duty of 35 per cent., while higher grades of steel, such as chrome and manganese, are admitted free.

The Powell Process for Timber Treatment.—The High Court of Australia recently gave judgment in favour of the Western Australian Government in the matter of termination of the Powell Company's patent.

The case had been referred to the High Court by way of appeal against the decision of the Court of Western Australia on the issue whether Subsection 2 of the Patents Act could apply to a State patent. The Western Australian Court had decided in favour of the company, but the High Court, in reversing this judgment, found that the State Government is under no legal obligation to pay the £51,550 royalties, which was the amount involved in the termination of the contract.

The contract which was the subject of the above appeal was one entered into by the State Government with the Powell Process Company some years ago for the treatment of Karri timber for the prevention of dry-rot and attack by white ants when the timber is used in contact with earth, and involved certain royalties payable to the company for every cubic yard of timber treated by its process.

BRITISH INDIA.

The Proposed Indian Chemical Service.—In the *Gazette of India* for November 15 the Government published a "resolution" concerning the creation of a Chemical Service and an Indian Store Department, which, although it merely stated that committees are being formed to deal with those subjects, was nevertheless accompanied by a hundred foolscap pages of annexures. The proposal to form a chemical service, put forward at a conference at Lahore in January, 1918, by Sir Thomas Holland and elaborated in the report of the Industrial Commission published in November last, mét with the general approval of chemists in the service of the Indian Government. In the past chemists and other scientific experts have generally been engaged each on a separate agreement, the terms of which, however, do not as a rule materially differ. In nearly every instance the maximum pay is about Rs.1000 *per mensem*, which seems fairly satisfactory to young men commencing service, but, as is stated in the report of the Commission (p. 87):—"Many of the scientific specialists quickly reach their maximum salaries, and, witnessing the gradual rise in pay and position of their contemporaries in other services, naturally grow discontented, and consequently become of reduced value to the country. In view of the fact that no quantitative standard can be established to gauge scientific research, no one can say what the country loses by discontent among its scientific staff." Nevertheless, in its proposals for the establishment of the Chemical Service (p. 255) the Commission proposes only the appointment of one chief chemist at a salary of Rs.3000, and he is apparently to be recruited directly from England. The maximum salary of other chemists still remains at about Rs.1000.

Practically all the regular services, such as the Public Works Department, the Forest Service, the Police and the Education Department have either received recently, or are about to obtain, substantial increases of pay in consideration of the rise in the cost of living. It is interesting to compare the rates for chemists with the new scale for the engineers of the Public Works Department as announced in the *Gazette of India* for November 1. Their pay starts at Rs. 450 *per mensem*, and rises continuously to Rs. 1500 in the 20th year of service and Rs.1600 in the 23rd, but by that time a man would probably be a Superintending Engineer drawing Rs.1750, rising to Rs.2150; and some must rise to be Chief Engineers on Rs.2750 to 3000. The new rates for the Forest Service are very similar.

One of the suggestions of the Industrial Commission was that the chemists of the proposed service should be seconded for periods of five years to special appointments, such as agricultural chemist in a province or professor of chemistry in a university. A conference of agricultural chemists objected to this on the ground that it took a man a considerable number of years to become familiar not only with agricultural chemistry generally, but also with the conditions of a province, which are, as a rule, quite different to those in another province. This suggestion has consequently been

dropped, and hence, as a rule, a chemist will be appointed to do work of one specific kind during the whole of his service, unless his special experience is required for the central Government or for some other work.

In the *Gazette of India* for November 18 there is also an announcement of revised rates of pension, but many of the chemists will derive no benefit from these.

FRANCE.

Industrial Notes.—*Chemical Industry.*—The importation of German chemicals has begun on a scale large enough to allow a few chemical industries to be run at a fairly normal rate of production. Doubts are expressed in certain quarters if this new state of things can last long owing to the unsettled industrial conditions in Germany, which the winter is not likely to improve. No great reliance is placed on Italy either—whence France gets either directly or through England such products as aluminium salts, borax and boric acid, sulphur, sulphates, citric and tartaric acids, oils, etc.—on account of the great social unrest prevailing there, which has at its root the shortage of the most vital raw materials. Under such circumstances, and to meet her own great wants, France will have either to find substitutes for all these intermediates or develop new processes if she is to cope with her great economic difficulties, which can only be solved by intensive production. This effort she is prepared to make, but many difficulties are in the way, for, apart from the shortage of raw materials and of intermediates, and a still disorganised railway system, there is considerable labour unrest. Another factor retarding production in the chemical industries is a lack of co-ordination between the different factories, each trying to turn out as many different products as possible, thus dispersing instead of concentrating effort. The importance of organised specialisation is better understood now, and the evident results it will have on working costs will lead to its adoption.

Alsace-Lorraine.—The development of the natural resources of the recovered provinces is a favourite topic. Recent prospecting has revealed that the potash beds of Alsace can produce 300 million tons of pure potash, which represents an amount 300 times greater than the world's annual consumption before the war. The oilfields of Alsace are also eliciting great interest. They are chiefly located to the north-west of Strasbourg around Pechelbronn, extend over an area of 44,000 hectares, of which 14,000 can yield petroleum on a commercial scale, and are worked on very scientific lines. Quite recently oil was struck in a new boring on a quite virgin part of the oilfield, and this is estimated to give a daily yield of 30 tons. The current opinion on the iron-ore of Lorraine is that, although very abundant, its high phosphorus content will compel manufacturers to produce specialised goods, such as rails, joists, and section iron. Coal supply will be a great difficulty owing to the remoteness of the sources of fuel—North of France, Belgium, and Germany. Another drawback will be the shortage of labour, and recourse will have to be had to foreign workers.

Coal and Transport.—Production is improving in a very noticeable manner in the coalfields. The official figures for September amount to 1,687,000 tons, to which must be added 151,000 tons from the coalfields of Lorraine. The production for November—Lorraine excluded—will probably exceed 1,800,000 tons. Labour is abundant and especially so on the coalfields of the Central Plateau, where the rate of raising coal has doubled. Prospecting is rife all over France with a view to locating extensions of the different coalfields. This policy is dictated by the fears which the recent strikes in England and the United States have inspired. The various railway lines are being restored with great speed. On the Northern railways practically all the stations are now open to traffic. On the Eastern railways abundant snowfalls in November had a retarding effect, but work is progressing very favourably. On December 1 less than 100 kilometres out of the 367 kilometres of canals and waterways which at the time of the armistice were unnavigable remained to be open to navigation again.

Colonies.—Great interest is shown in the development of the graphite beds of Madagascar, which are reckoned to be superior in value to the potash deposits of Alsace. Mining began in 1910, and the production rose from 6572 tons in 1913 to 27,838 tons in 1917. The development of the industry was retarded by the badly prepared state in which the material was marketed, but methods of purification have been improved at no great expense, and the quality of the new grade determines a ready sale. Mining is easier than in Ceylon because the deposits can be worked in the open. Indo-China is also rich in graphite, and from Annam 8000 tons was recently exported to America and 15,000 tons more are ready for shipment.

Of all the French colonies Tonkin is the richest in coal, the output in 1916 having reached 695,000 tons. Fresh deposits of anthracite have just been discovered. New Caledonia also has rich deposits which have hardly been touched, and the same applies to the lignite of Madagascar. Yet, in spite of these natural resources, 600,000 tons of coal was imported into the French colonies, not including those of North Africa.

The production of phosphate in Algeria and Tunis for 1920 is estimated at 1,400,000 tons, which will be distributed thus: 700,000 tons to France; 247,600 to England; 355,000 to Italy; 14,700 to Portugal; 3600 to Belgium; 550 to Switzerland; and 73,600 to Spain.

UNITED STATES.

American Ceramic Society.—The annual meeting of this society will be held at Philadelphia from February 23 to 26. The headquarters will be at the Bellevue-Stratford Hotel, where rooms are available for general and sectional meetings, and where social functions will be held.

Dietetic Values.—As a part of its extension work, the University of Illinois is distributing a "Home Meal Calendar" which enables households to keep a daily record of their consumption of protein, starch, fats, sugars, and organic acids and mineral substances. The desirability of having all five groups represented in the diet is pointed out.

Compulsory Licensing of Engineers.—The State of Michigan has introduced an innovation in the form of a law compelling engineers, including chemical engineers, to be licensed. Applicants will be required to prove their competency as regards knowledge of fundamentals and ability to solve technical problems correctly on paper. The experiment will be watched with great interest by the chemical profession.

Rare Earths for the Incandescent Mantle Industry.—Surveys in the Southern States have revealed the frequent occurrence of these rare earths in ground which has no agricultural value. These minerals would doubtless not have been discovered but for the impossibility of importing the purified earths during the war. Incidentally the explorations have led to an increase in the output of meso-thorium, for which there is an active demand.

New Method of Food Dehydration.—On December 5, Dr. K. G. Falk, of the Harriman Research Laboratory at New York, explained the new method of food preservation elaborated at that institution before the New York Section of the American Chemical Society. The method consists, briefly, in

dehydrating the food (meat, eggs, vegetables, fruits) in a comminuted state in a vacuum drier at a temperature well below that at which changes incidental to cooking occur. No preservatives or bleaching agents are required. A variety of meats and vegetables dried by this method had been shipped to different parts of the world with successful results.

The American Petroleum Institute.—It is anticipated that this Institute will soon complete the organisation of its Division of Research and Statistics, and that it will receive annually a sum of $500,000 obtained by a levy on the gross business of the producers and refiners of petroleum. The director of the Division will have the assistance of an advisory committee composed of representatives of the Government Departments directly interested, the national engineering societies, the National Automobile Chamber of Commerce, the American Chemical Society, and the National Research Council.

A New Therapeutic Agent.—Drs. Young, White, and Swartz, of Johns Hopkins Hospital, have carried out a series of studies with a view to the discovery of a therapeutic compound which would be germicidal, relatively non-toxic and non-irritating, while possessing unusual penetrating qualities. Such a substance has been found in dibromoxymercuryfluorescein or its sodium salt, the latter carrying approximately 26 per cent. mercury. A considerable number of observations has been made, and the experimenters, in summing up their conclusions, state that the new germicide, which is for use in the genito-urinary tract, has practically fifty times the germicidal strength of acriflavine, and that a solution of one in one thousand kills *B. Coli* and *Staphylococcus aureus* in one minute in urinary media (presumably *in vitro*). The new drug is tolerated for from one to three hours without irritation by the human bladder, and injections of a 1 per cent. solution in the renal pervis are likewise free from pain. Studies of the comparative value of this drug and acriflavine are not yet completed, but it is considered certain that methods of great value in the treatment of certain diseases with both drugs have been discovered.

Metallurgical Notes.—It is reported that each of the various high speed steels emits a characteristic spark upon coming into contact with an abrasive wheel. These sparks vary in size, shape, and colour, and the method is in use for sorting scrap.

The large quantities of copper-nickel scrap now existing have given rise to attempts to use it for brass and bronze manufacture, the nickel, it is said, replacing some of the tin content. Preliminary work has in some cases given satisfactory results.

A committee has been formed in the Division of Engineering, National Research Council, to investigate and improve the method for the magnetic testing of ferrous metals. The need for testing methods which are reliable and yet do not involve the destruction of the sample calls for special attention.

Large spangles having been found to increase both the non-corrosive qualities and appearance of galvanised iron, experimenters have been busy devising ways that would insure a larger percentage of large spangled sheets. By using a titanium alloy in the manufacture of the steel employed, it is claimed that 75 per cent. of the sheets are to be found with the desired formation of the zinc crystals.

Arrangements have been completed so that work may begin at once on fatigue phenomena of metals at the University of Illinois under the auspices of the National Research Council and Engineering Foundation. Metallurgists are co-operating, especially in supplying proper samples for the tests. The subject makes a wide appeal, and there is every reason to expect important results. Professor Moore is in immediate charge.

Sugar Industry of the Philippine Islands.—In 1893 the Philippine Islands exported 260,000 tons of sugar. As a result of the Spanish-American War this export dropped to 63,000 tons in 1900, but has since exhibited an upward tendency, reaching 101,000 tons in 1905. There is even good reason to anticipate, in time, a possible annual output of at least 1,000,000 tons; for the area of the Philippines is double that of Java, with an annual output of 1,000,000 tons. Further, the soil is good, the climate favourable, and labour cheap; also sugar cane can be grown in nearly every part of the Islands. Up till now the industry has been so primitive and the methods of manufacture so antiquated that the yield of crude sugar has never exceeded 1·25 tons of crude sugar to the acre. To-day efforts are being made to do away with these unfavourable conditions as far as possible, and this is to be achieved mainly by a system of co-operation, the formation of central mills and the production of more centrifugal sugar, in place of the native muscovado and pilon sugar, the demand for which is, in fact, slackening. The cost of producing a ton of good centrifugal of 96° polarisation is practically no more than the cost of making muscovado or pilon sugar, whereas prices obtained for the former are double those of the latter. Already many small planters are selling their muscovado to large mills or "centrals" for the purpose of having it converted into centrifugal sugar, the export of which has increased from 47,234 tons in 1917 to 64,018 tons in 1918.—(*U.S. Com. Rep., Oct.* 23, 1919.)

JAPAN.

Paper from Seaweed Pulp.—H.M. Commercial Secretary in Yokohama reports the formation of a company with a capital of 2,000,000 yen (approx. £200,000) to manufacture pulp from seaweed (ajimo) and papers of all kinds.—(*Bd. of Trade J., Dec.* 4, 1919.)

Japanese Celluloid Manufacturers.—The Acting Vice-Consul at Osaka reports that the amalgamation of eight Japanese celluloid companies into the Dai Nippon Celluloid Company with a capital of yen 12,500,000 (£1,276,000) has been effected. The object is to bring about a more economical use of the available supplies of camphor by the concentration of manufacture in the factories of four of the companies so as to secure the advantages of keeping both machinery and operatives working full time.

The annual production of celluloid is now 6,000,000 lb., worth £1,300,000, and is three times the pre-war output. Three-quarters of the raw camphor (which is a Government monopoly) produced in the Japanese Empire comes from Formosa, where efforts are being made to increase the output. The remaining one quarter is produced in Japan itself. Owing to exports, only one quarter to one half of the total production is available for celluloid manufacturers. Future German competition is feared, as it may be possible to effect economy by the use of artificial camphor.—(*Bd. of Trade J., Dec.* 18, 1919.)

GENERAL.

Ramsay Memorial Fund.—The Ramsay Memorial Fund has received from Prof. H. Kamerlingh Onnes the very substantial sum of £1571 9s. 5d., which has been given or promised by donors in Holland. These generous contributions are evidence of the sympathy felt in Holland for British science and scientists, and the respect so widely felt in Holland for the memory of the late Sir William Ramsay. Among the subscriptions are: Philips Gloeilampenfabriek, £500; Fransch Hollandsche Cliefabrieken, Delft, £300; Nederlandsche Gist and Spiritus-

fabriek, Delft, £300; Van den Bergh's Fabrieken, Rotterdam, £300; and Lym and Gelantinefabriek, Delft, £100.

The Hiding Power of Pigments.—An instrument for which the name of "Cryptometer" (κρύπτω, conceal; μέτρον, measure) has been proposed places in the hands of the paint technologist a means whereby the long-felt want of a simple method of determining the hiding power of pigments can be carried out in the laboratory without undue introduction of the personal element. Hiding power or opacity of pigments has hitherto been carried out by finding the weight of paint necessary to produce obscuration of black lines or alternately-placed squares on a white background by application of successive coats of the paint under examination. Apart from its tedium, the method was at best approximate in accuracy, mainly on account of the difficulty of securing equal distribution of the coating. It required, moreover, for anything like successful application the services of a skilled craftsman. The simplicity of the cryptometer favours its rapid adoption in works' laboratories, where this most important factor in the valuation of pigments has hitherto been in many cases left undetermined. It is to be hoped that quantitative evaluation of white pigments in terms of opacity by this instrument will replace the meaningless analyses so often figuring as standards in specifications of white pigments and paints. (See also this issue, p. 34 A).—(*J. Franklin Inst., Nov.*, 1919.)

Proposed British Beet Sugar Industry.—The present and prospective shortage in the supply of sugar for home consumption, largely brought about by the disorganisation of the industry in Germany and Austria which formerly provided 53 per cent. of our imported supplies, again raises into importance the possibility of establishing a home industry in this essential commodity. An abortive effort to establish a beet sugar factory at Lavenham, in Suffolk, was originally made some fifty years ago. The enterprise was strongly supported by Lord Denbigh, who, some twenty years ago, carried out experiments with a view to proving that sugar-beet, of which farmers knew nothing, could be grown profitably in this country. The next step was the formation of the National Sugar-Beet Association, strongly supported by the Duke of Bedford and other leading agriculturists. This carried out much useful experimental work right down to the commencement of the war, an attempt being made in 1912 by means of a factory erected at Cantley in Norfolk to put the industry on a working basis. Unfortunately the necessity of providing a substantial area of suitable land for the production of roots adjacent to and under the control of the factory was overlooked. Production was left entirely to the enterprise of the farmers, who failed to provide the roots in quantities sufficient to make the undertaking a success.

In 1918 the British Sugar-Beet Growers' Society, Ltd., formed in 1915, purchased the Kelham Estate, near Newark, Nottinghamshire, a portion of which was subsequently sold to the Board of Agriculture to be developed as a farm colony under its Land Settlement Scheme. The remainder, some 2,800 odd acres, is worked as a large farm with the ultimate object of introducing sugar-beet as the main crop as soon as a factory can be erected. Meanwhile the land is devoted to cereals and stock, with a small area of sugar-beet for feeding and for seed production. The manager of the estate is Mr. Sidney Colyer, formerly farming assistant to Sir Daniel Hall, and he acts under the control and direction of a Joint Committee of the Board of Agriculture and the Sugar-Beet Growers' Society. The latter has now brought the enterprise to a point where, to establish it on a sound commercial footing, a large outlay of capital is required. With this object in view it is now proposed to form a public company, and the Government contemplates taking up a portion of the capital. The title of the proposed company will be "Home Grown Sugar, Ltd.," and the nominal capital £1,000,000; half of this will be issued, and it is proposed that the Government will take up £250,000, and the remainder offered to the general public. It is believed that such a company will be in a position to pay a remunerative price to the farmers for their roots and to sell the sugar at a price which, even allowing for a heavy fall in the market, will afford a substantial interest as an industrial proposition.

From a national point of view, the success of this undertaking is greatly to be desired. Not only does it provide an ultimate means of making the country more self-supporting in regard to the beet sugar supply, but it will confer great benefits on agriculture. It may be remembered that under the Finance Act of 1919, sugar produced in this country will enjoy a preference over foreign imported sugar of £6 4s. 5½d. per ton, and of £1 18s. 10 ¾d. per ton over sugar imported from British Dominions and Colonies. Before the war more than 90 per ecent. of our sugar came from foreign countries. It has already been proved that we have the soil and the climate to produce sugar-beet to the best advantage; it would therefore appear to be only a question of enterprise on the part of the farmers and support from the general public to carry the project to success.

Neon.—In a recent communication to *Nature*, Mr. F. W. Aston, of Cambridge University, announced that by using a new and more powerful method of positive-ray analysis, he has succeeded in obtaining indisputable evidence that atmospheric neon (atomic weight 20·200, O=16) is a mixture of two isotopes having the atomic weights 20·00 and 22·00 respectively.

Argon.—The boiling points of argon and oxygen being different by about 4° C. only, and those of oxygen and nitrogen by 13° C., any impurity in the liquid oxygen collecting at the base of an air rectification column consists mainly of argon. The proportion of this impurity is increased somewhat by regulation, and the liquid is then passed into a special column, where it is subjected to a further rectification before being gasified to furnish the oxygen product. The impurities are withdrawn from the system, (1) as a gas containing 60—65 per cent. argon and 1—4 per cent. nitrogen (the remainder being oxygen) at the rate of 600—700 litres per hour, and (2) as a gas consisting of nitrogen, with a trace of oxygen. After removing the oxygen from the three component mixture, by combustion with hydrogen, an argon-nitrogen mixture is obtained containing only a small proportion of nitrogen.

Within the last few years a use has been found for argon in the electric lamp industry. It had been thought that the most perfect vacuum was necessary in lamps; not only to prevent oxidation of the filament, but also to prevent heat losses by conduction and convection. It was subsequently found that the volatilisation of the filament was diminished in an atmosphere of nitrogen, thus permitting a higher temperature and a better lighting efficiency, the gain in intensity of illumination far outweighing the loss of heat. Later it was discovered that argon further retarded volatilisation, thus allowing of a still higher filament temperature. There has consequently arisen a considerable demand for argon, and the British Oxygen Co. has now installed at its new Wembley works a plant for extracting argon from the air, and a second at its new factory in Birmingham.—(*Ind. Gases, Dec.*, 1919.)

Gums, Bitumen, and Limestone in Mesopotamia.—The small shrubs which yield gum tragacanth grow throughout the entire mountainous region on the north-west frontier of Mesopotamia, and are tapped by the Kurds, who make incisions in the roots after first burning the leaves off the bushes. The first tapping gives white gum of the best quality; that from subsequent tappings is inferior and of a yellow colour. The chief collecting centre is Suleimanaya, whence the gum is sent to merchants in Baghdad, who export it to foreign countries (130 tons in 1887, 39 tons in 1890). Another gum called "elk" in Arabic is obtained as an exudation from incisions made in the trunk of the tree (known as "buttom" by the Arabs and "gykraswan" by the Kurds), which grows, but only in the valleys, in the part of Kurdistan now occupied by the British. Most of this gum is exported directly from Suleimanaya to Aleppo, where it is used for sizing cloth, and some goes to Baghdad to be used locally for the same purpose and in the preparation of sweets, etc. Both gums are produced in the Mosul Vilayet, but there is no organised trade in them in that district, partly on account of the imperfect roads.

Almost unlimited deposits of crude bitumen and of limestone impregnated with bitumen occur round Hit, but the secrets of lime burning and of refining the bitumen are jealously guarded by the local experts, without whose co-operation nothing can be done in the absence of scientific advice. The possible monthly outputs of lime and of refined bitumen are, respectively, 300 to 150 tons and 600 to 300 tons, calculated from the figures given for the amount of the fuel "siyalla" (a highly-oxidised bitumen) available monthly, but more of this fuel is probably obtainable.—(*Bd. of Trade J., Nov.* 20, 1919.)

Agriculture in Jamaica.—The year 1918 was, on the whole, a satisfactory one for agriculture in Jamaica. The institution of central co-operative sugar factories under Government guarantee, but managed by planters, is calculated to lead to satisfactory results. Such a system should secure equal rights to all, a fair division of profits, and prevent the development of large capitalistic combinations. It is thought that with remunerative prices for sugar, and the security afforded by Imperial preference, bananas will give way to sugar to a greater or less extent in areas favourable for sugar production. The market for cacao showed some improvement during the year, the exports being valued at £154,000, as against £117,000 during 1917. With the Imperial preference of 7s. per cwt. for cacao a distinct encouragement to this product is now afforded, and the planting of cacao by small settlers should again be taken up with vigour. Pimento was in fair demand, and this should increase with the opening of the markets of Central Europe. Ginger, which is chiefly a small man's crop in Jamaica, had another good year with an export value of £85,000, as against £70,000 in 1917 and £30,000 before the war. Annatto, another minor product, did very well with an output of about 450 tons, valued at £18,000.—(*Rept. of Dept. of Agric., Jamaica*, 1918–19.)

Copper Smelting in Peru.—H.M. Commercial Secretary in Lima reports that a well-known American company has decided to construct a new smelter at Oroya at a cost of approximately £2,000,000. The present smelter has five blast and four reverberatory furnaces, and the additions are to include two furnaces of each kind with a capacity double that of the old. The smelting capacity will in this way be increased from about 1,500 to 2,500 tons of ore. The new plant is expected to be completed in two years.—(*Bd. of Trade J., Dec.* 25, 1919.)

Coal Storage in Carbon Dioxide.—A novel method of storing coal in carbon dioxide has been adopted recently at Dortmund, in Germany, in order to prevent the possibility of spontaneous ignition. The storage arrangements consist of three cylindrical bunkers, with semi-spherical tops and bottoms, each bunker holding 2,500 tons of coal. There are three outlets in each bunker for withdrawing the coal, and three holes in the top for receiving it, the lower outlets closing gas-tight. There is a slight leakage of carbon dioxide during the withdrawal of the coal, but this can be replenished without difficulty.—(*Gas. J., Dec.* 16, 1919.)

Comparison of German, American and English Coke-Oven Plants.—In an article appearing in the *Zeitschrift des Vereins deutscher Ingenieure* for Nov. 8, 1919, it is remarked that whereas American coke-ovens are, as a rule, erected near foundries, in Germany they are situated in the neighbourhood of coal mines. The American practice assures that the blast foundry is supplied with the class of coke desired by the owner who exercises some supervision over the operation of the coke-ovens. The following table gives data relative to the respective coking installations in Germany, the United States and England:—

	At end of 1914.			At end of 1918.		
	Germany.	United States.	England.	Germany.	United States.	England.
				(apprx.)	(apprx.)	(apprx.)
Yearly throughput of coal in by-product coking ovens (million tons)	35	26·5	15	41	50	21
Number of by-product coking ovens ..	20,173	6,438	7,813	22,003	9,940	9,827
Yearly throughput per oven (tons).. ..	1,750	4,100	1,900	1,800	5,030	2,130

It is contended that America's advantage in the matter of cheap coke production can only be met by imitating the American mode of installation. In 1918 by-product coking-ovens contributed 45 per cent. to the total coke production. As only about 60 per cent. of the by-products is recovered in beehive ovens, compared with 82 per cent. in the modern by-product coking-ovens, America economised to the extent of about 13,000,000 tons of coal in 1918 compared with previous years.—(*Z. angew. Chem., Nov.* 25, 1919.)

Outlook for Professional Chemists in Germany.—The "Verein deutscher Chemikerinnen" (Society of German Women Chemists), which is affiliated to the "Verein deutscher Chemiker," has recently sanctioned the publication of a cautionary notice against the choice of chemistry as a profession under present economic conditions. During the next few years the absorption of present students of chemistry, whose number is steadily increasing, will be impossible; and the many chemists accredited with war service will have first call on the industry. The sphere of work of a female chemist is very restricted, and this, together, with hygienic and mental considerations, leads the Society to advise women to avoid the profession. The "Bund angestellter Chemiker und Ingenieure" has recently issued a brochure dealing with the difficult position of the industry and the danger of its becoming overcrowded. Students are accordingly strongly urged not to take up the study of chemistry. The *Zeitschrift der angewandte Chemie* directs attention to the false assumption that underlies the calculations made in the publication, namely, that the number of chemists in Germany before the war was 15,000; this figure, it states, is quite 50 per cent. too high.—(*Z. angew. Chem., Nov.* 11, *Dec.* 9, 1919.)

Partition of the Austro-Hungarian Industries.—Of the total output of pig iron of the former Austrian Empire, amounting to 14,293,884 cwts., that associated with the new Austria is 5,500,000 cwts., and that with Czecho-Slovakia 7,000,000 cwts. The shares of Poland and Trieste amount to 1,700,000 cwts. and 300,000 cwts., respectively The iron industries of Prague, Kladno, Witkowitz and Mahrisch-Ostrau are included in the new Czech state where large extensions are being undertaken, *e.g.*, by the firm of C. T. Petzold at Komorau. In the new Austria, except for a number of small firms such as the Sulzau-Werfen ironworks at Salzburg, there are only the Alpine Montangesellschaft with its works at Donawitz and two others. The annual output of ore in Austria amounts to 18,600,000 cwts., while that of Czecho-Slovakia is not quite 7,000,000 cwts., therefore in this matter the relative positions of the two States are reversed. The ouput of the Styrian mines formerly constituted two-thirds of the total production of the Austrian Empire, so that in default of being able to secure supplies elsewhere, and this has now been the case for some time, Czecho-Slovakia will be compelled to derive its supplies of iron ore from Austria. The ores themselves are very puro and also contain the necessary flux in the form of limestone.

The zinc industry is now located in the Jugo-Slav region. Zinc ores, even those mined in the Tyrol, were formerly brought to Unterkötting near Cilli to be smelted and the zinc production therefrom in 1915 was 40,253 cwts. Very little zinc occurs in the southern Slav regions, and its smelters will therefore not be employed to the same extent as formerly. German Austria must therefore provide itself with a smelting industry. The Polish region has its own zinc smelters at Trzebinia, and also zinc sheet mills, which produced, in 1915, 54,470 cwts. of spelter and 19,672 cwts. of zinc sheets. In the old Austrian Empire. one works only is of importance, for the production of metallic tin, namely the works at Teplitz, now alloted to Bohemia. Copper works are located practically entirely in the new Austria. The output of the Mitterberger Kupferaktiengesellschaft of Ausserfelden (Salzburg) amounted in 1915 to 28,965 cwts. refined copper, 20,095 cwts. electrolytic copper, and 86 cwts. of copper sulphate The output of lead ores in the last year of peace amounted to 257,511 cwts. of which 177,553 cwts. was obtained from Carinthia, 5,054 cwts. from the Tyrol and 71,434 from Galicia; 75 per cent. is therefore obtainable from German regions, the remainder from Poland. Red lead, white lead and litharge were obtained from works in Klagenfurt in the old Austrian Empire, and in normal times in sufficient quantity to supply the needs of the whole Empire. There is therefore every prospect of the possibility of German Austria exporting these materials. Antimony ores, of which the output was 12,701 cwts., are found in the Jugo-Slav region. The ores of uranium and tungsten are mined in German Bohemia. In the year preceding the war manganese ores were mined to the extent of 165,400 cwts., of which 157,090 cwts. was obtained from the region of Czernowitz, the remainder from Laibach. Sources of bauxite in the old Empire are confined entirely to the southern Slav region.

Czecho-Slovakia leads in the enamel industry, possessing an output equal to 90 per cent. of the factories of the old Austrio-Hungarian monarchy; nine factories are located in Czecho-Slovakia, four are in the New Austria, and three in Bohemia. The Polish and Illyrian regions each possess one factory. The most important enamel undertaking on the Continent is the A.-G. Oesterreich, with headquarters in Vienna, and whose works are situated in German Austria and Czecho-Slovakia. With sufficient supplies of raw materials the works in Austria will be able to meet the demands of the State. The export of enamelled vessels which in normal times absorbed 60 per cent. of the enamel produced will be in the hands of Czecho-Slovakia in future. (*Handels-museum*,* also *Schweiz-Chem. Zeit., Sept.* 24, 1919.)

Uses of Manganese Dioxide Ore.—Estimates of the consumption of high-grade manganese dioxide ore for other than metallurgical uses vary from 25,000 to 50,000 tons per annum. The ore most in demand is the best pyrolusite, which is used chiefly in the production of dry cells, as a dryer for paint and varnish, and for decolorising glass.

In dry cells the function of the ore is that of a depolariser, and for this purpose it must have a high content of available oxygen and be free from metals electronegative to zinc, such as copper, nickel, cobalt, and arsenic. Of these metals copper is by far the most objectionable, but little harm results if the metals are present in a form insoluble in the electrolyte employed in the cell. If present in a form soluble in the electrolyte, however, they are finally deposited on the zinc of the cell, thus causing local corrosion, which is greatly intensified when the cell is in use. Before the war Caucasian pyrolusite containing from 80 to 85 per cent. of MnO_2 and less than 1 per cent. of iron was used. When this material, which was of uniform composition and purity, was no longer available makers of dry cells had to utilise ore from other sources containing 70 to 80 per cent. of MnO_2 and as much as 3 or 4 per cent. of iron. Experimental work has indicated how material of this character can be made to give results almost as good as those obtainable with the purest Caucasian ore. The physical condition of the ore is of considerable importance in dry cell manufacture, porosity and moderate hardness being the most desirable properties. Such an ore is preferable to a very hard and dense material even when the latter contains a somewhat higher content of available oxygen. Careful sizing of the particles is also required, very fine powder being often removed as it will hold considerably less of the electrolyte than material which has been ground only to pass a 10 or 20 mesh screen. It is thus evident that many ores of an earthy character, such as wad, are not suitable for use in dry cells.

Manganese dioxide is more often used than selenium, nickel, or cobalt for neutralising the green tint produced by the presence of iron in glass. Pre-war specifications usually required 80 to 85 per cent. of MnO_2 and less than 1 per cent. of iron. Carbonaceous pyrolusite is objectionable, but the silicious variety is permissible. Powdered ore is usually employed where the glass is made in pots, whilst the lump or granular variety is frequently employed when tanks are used for the melting. The amount of manganese dioxide added varies from 2 to 15 lb. per 1000 lb. of sand in the batch. An ornamental black glass has been produced by adding about 3 per cent. of the ore to the glass mixture. Manganese dioxide is also used in the preparation of purple glazes and enamels.

Manganese dioxide, either natural or artificial, is extensively used as a "dryer" for linseed and other oils. The quantity added rarely exceeds 0·5 per cent., but it is stated that even this amount tends to darken the oil; this objection, however, does not hold in the case of certain salts of manganese, such as sulphate, borate, oxalate, resinate, and linoleate, which are also largely used.

Manganese dioxide also finds application in the preparation of the chloride, used in dyeing cotton cloth brown, and in the production of potassium permanganate.—(*United States Bureau of Mines Min. Invest. Series No.* 16.)

PARLIAMENTARY NEWS.

HOUSE OF COMMONS.

Import Restrictions.

Sir A. Geddes, replying to Sir D. Maclean, said that, in view of the Sankey judgment (this J., 1919, 481B), the Customs have been instructed, pending reversal on appeal or legislative action, to allow the importation of all articles affected thereby. Early next Session the Government will press forward legislation for the purpose of reimposing restrictions of the limited scope indicated in the Imports and Exports Regulation Bill. At present the Government is not in a position to restrict importation from countries affected by a collapse in exchange.—(Dec. 18.)

In reply to Mr. Hogge, Mr. Bonar Law stated that the Government had not decided to abandon the above-mentioned Bill.—(Dec. 22.)

Cement.

In answer to Mr. J. Davidson, Mr. Bridgeman said he understood that prohibitions on the export of cement are in force both in Germany and in Denmark. However, there are ample supplies available in this country, and there should be no necessity to import it.—(Dec. 18.)

Oil Fuel Locomotives.

Mr. Neal, replying for the Minister of Transport, informed Major G. Palmer that the railway companies are considering the question of the use of liquid fuel in place of coal. Liquid fuel was used successfully by one company from 1886—1906, when its use was abandoned on account of the price. There is no doubt that some of the railways will commence using it again as soon as it is economical to do so.—(Dec. 18.)

Cardigan Metal Mines.

Replying to Mr. W. Thorne, Mr. Bridgeman confirmed the statement that during the last 100 years over 260 metalliferous mines have been operated in Cardigan, 194 lead mines in Derbyshire, and 259 mines extracting tin, lead, copper, and zinc ores in Cornwall. At the present time there are working 4 mines in Cardigan, 2 in Derbyshire, and about 50 in Cornwall. The decline in the industry is now the subject of investigation by a Departmental Committee.—(Dec. 19.)

Dyes.

Asked by Mr. Sugden as to the facilities for obtaining certain essential dyes which have not been manufactured in this country, and if he would expedite their delivery, Sir A. Geddes said that arrangements have been made for obtaining supplies from Germany in advance of the formal ratification of the Treaty. About 350 tons have actually arrived, and further quantities are in transit.—(Dec. 22.)

Fertilisers.

Questioned by Lieut.-Col. Sir N. Griffiths as to the Government's intentions with regard to the decontrol of fertilisers, Sir A. Boscawen explained that apart from the imposition of maximum prices for basic slag and sulphate of ammonia, and certain arrangements made (also in the case of superphosphates) in connexion with their production and distribution in home markets, these fertilisers are now free from control. Control of the exportation of fertilisers is still necessary in order to safeguard supplies for home consumption, but licenses therefor are freely granted, and it is hoped to discontinue this control as soon as practicable.—(Dec. 22.)

Palm Kernels.

Sir H. Craik asked the Minister of Food if he would consider the advisability of removing the prohibition on the export of palm kernels imported from British Possessions in view of the fact that Brazilian babassu kernels and shea nuts were imported without restrictions.

Mr. Roberts replied that the Brazilian materials were imported only in small quantities and were not yet staple raw materials for margarine manufacture. The re-export of West African palm kernels would not only tend to congest the ports still further, but would take up British shipping required for other purposes.—(Dec. 22.)

Storage of Petrol.

The Home Secretary, in reply to Viscount Curzon, said he was advised that bulk storage of petrol in underground tanks was by far the safest, most convenient, and most economical method, and that it should be encouraged. He believed it was the policy of his Department to increase the amount of storage in this country for oil fuel of all kinds.—(Dec. 23.)

Industrial Courts Act, 1919.

A Bill introduced by the Minister of Labour to promote arbitration or conciliation in industrial disputes, and to maintain wages at the war standard until September next, received the Royal Assent on November 20 last. The measure places on a permanent basis the Interim Court of Arbitration which was instituted in January last, and which had before it some 853 cases, all of which, except three, were settled without a strike. Under the new Act a dispute in any trade may be referred by the Minister of Labour to a Court of Arbitration or a Court of Inquiry, but only with the consent of the parties concerned. The decisions of a Court are not legally binding.

Trade Marks Act, 1919.

The Trade Marks Bill received the Royal Assent on December 17 last, after the amendments made by the House of Lords had been agreed to. These amendments included one to Clause 2, making it clear that the Registrar is not compelled to institute a search before accepting a mark intended for Register B; and in Clause 6 the following words were added: "No word which is the only practicable name or description of any single chemical element or single chemical compound, as distinguished from a mixture, shall be registered as a trade mark." A new clause concerning the registration of assignments was introduced in place of Clause 11. The Act will come into operation on April 1, 1920.

Electricity (Supply) Act, 1919.

After drastic alterations in the House of Lords, the Electricity Bill was passed by the House of Commons and received the Royal Assent on December 23. The alterations comprised the deletion of the proposal to institute district boards empowered to provide electrical power and to acquire existing generating stations and main transmission lines within their areas. Electricity Commissioners are, however, to be appointed, and these will have power to veto proposals for extending existing generating stations, and in the event of an adequate scheme not being forthcoming, they may formulate, and, if necessary, enforce a scheme of their own. Power is given to them to incur a total expenditure of £20,000,000 in the construction of necessary generating stations. The Government has announced its intention to re-introduce the proposals concerning district boards at an early date.

The Patents and Designs Bill.

On December 17, the Solicitor-General moved the Lords' amendments, the more important of which are: (1) In Clause 1, dealing with provisions for the prevention of abuse of monopoly rights and in Clause 2 dealing with "Licences of Right," a licensee is entitled to institute proceedings for infringement in certain circumstances and to make the patentee a defendant; the amendment provides that a patentee thus made a defendant shall not be liable for any costs unless he enters an appearance and takes part in the proceedings. (2) Clause 7 of the Bill provides that when considering a petition for the extension of the term of a patent the Court may take into account any loss or damage occasioned to the patentee by hostilities between His Majesty and any foreign State, except in cases where the patentee is the subject of any such foreign State; the amendment considerably broadens this provision by including under the term damage, loss of opportunity of dealing in or developing the invention owing to engagement in work of national importance connected with such hostilities; furthermore, the application for extension, when hostilities form the basis thereof, may be made by originating summons instead of by petition, thus avoiding certain costs. (3) Clause 8 of the Bill is eliminated by the amendment, that substituted differing mainly in that when a Government Department has used an invention and the Court, or arbitrator instructed by the Court, considers what compensation is due to the patentee, it or he shall have regard to any compensation which may have been already granted by Mr. Justice Sargant's Commission at present sitting, and as a corollary the Clause is not to come into force until that Commission has completed its work. (4) Clause 16 of the Bill deals with registration of assignments, etc.; the amendment is a re-drafting of the clause by Lord Moulton, the chief change in substance being a proviso that notwithstanding entries in the Register of Patents, any equities in respect of a patent may be enforced in like manner as in respect of any other personal property. (5) Under the heading Minor Amendments of the Principal Act is one that excepts the reading of a paper by the inventor before a learned society or the publication of the paper in the society's transactions, from among the publications which will invalidate a patent granted to the inventor subsequently to such publication.

The various amendments were adopted. With certain exceptions, the provisions of the Act came into operation on December 23 last.

GOVERNMENT ORDERS AND NOTICES.

PROHIBITED EXPORTS.

The Board of Trade (Licensing Section) has removed, as from December 24, 1919, the following articles from List A and/or B of Prohibited Exports:—Cotton seed; feeding stuffs containing molasses; soya beans; patent and proprietary cattle foods of all kinds; all cakes and meals which may be used for forage or food for animals, with the exception of cottonseed cake and meal, linseed cake and meal, maize germ meal, maize meal and flour, husk meal, all of which are to remain on List A.

The heading "Coal Tar, all products obtainable from and derivatives thereof, etc.," on List A, has been deleted and the following substituted:

(A) Coal tar, all products obtainable therefrom and derivatives thereof, whether actually so obtained or derived from other sources (including all mixtures and preparations containing such products and derivatives), suitable for use in the manufacture of dyes or explosives.

LEGAL INTELLIGENCE.

CLAIM FOR DAMAGE TO GLUCOSE IN TRANSIT. *Reynolds and Sellers* v. *Great Eastern Railway Co.*

In the King's Bench Division, on December 16, Lord Justice Bankes disposed of an action brought by Messrs. Reynolds and Sellers, of Mincing Lane, London, against the Great Eastern Railway Company, as carriers, to recover £502 in respect of damage to a number of bags of glucose chips in course of transit from Norwich to London.

The case for the plaintiffs was that Messrs. A. J. Caley and Son, Ltd., glucose manufacturers, of Norwich, had handed the goods to the railway company in a perfectly dry condition, but that upon delivery at Wapping 85 of the 200 bags were damp and torn, and the contents damaged by moisture. The defence contended that the goods when handed over at Norwich were in a damp condition, and that even if they were not, the railway company was excused because there was "an inherent vice" or tendency in glucose chips to absorb moisture from the atmosphere, and that occurred on this occasion.

Scientific evidence was given on both sides as to the effect on glucose of exposure to the atmosphere.

Lord Justice Bankes, in giving judgment, said that it was possible that damage could be caused by exposure to the natural atmosphere, but he was satisfied that such exposure had not occurred when the goods in question were under the charge of the railway company. The action was accordingly dismissed with costs.

CORROSION OF SHIP'S PLATES BY DISSOLVED COPPER SULPHATE.

In the Admiralty Court, on December 19, Mr. Justice Hill gave judgment in an action brought by the owners of a mixed cargo of copper sulphate in bags and cotton yarn, on board the small steamship "Yorkshire," built in 1893. They claimed damages for alleged breach of contract owing to the unseaworthiness of the ship. The defence of the shipowners was "perils of the sea."

In the course of his judgment Mr. Justice Hill said that the case turned upon the question of the seaworthiness of the ship. The plaintiffs said that owing to the failure of a lead pipe and to a defective storm valve in the ship's side, sea water entered the hold and, dissolving the copper sulphate, produced a highly-corrosive acid solution which damaged the cargo; also that the acid attacked and ate through some of the bottom plates which were already thin and corroded before the voyage was undertaken. The defendants contended that the pipe was sound, but had cracked owing to stormy weather, and that the valve was reasonably fit for its purpose; also that the bottom plates were sound, and that the corrosion was due entirely to the acid and wholly caused during the voyage.

His Lordship thought that the lead pipe probably became cracked on the preceding voyage, but the matter was left in doubt, and the onus was on the plaintiffs. The crack was the initial cause of the damage, and the latter was greatly aggravated by the invasion of water through holes in the bottom plating. The cause of the holes was the acid produced by the solution of the copper sulphate. There was most conflicting expert evidence as to the time it would take for such a solution to corrode the plate. Looking at the evidence as a whole, he drew the conclusion that in this case the acid had acted with unusual rapidity, but he could not say that the plates must have been so unsound before the acid reached them as to make the ship unseaworthy. The onus being on the plaintiffs, he was unable to find that there was evidence either that this ship was unfit for the

voyage in so far as it had a weakened or cracked pipe prior to sailing, or that it had bottom plates which were not able to stand the ordinary risks of the voyage. He held that the defence of "perils of the sea" had succeeded, and there must be judgment for the defendants with costs.

COMPANY NEWS.

POWER-GAS CORPORATION, LTD.

The annual meeting was held in Manchester on December 18 last. Mr. E. Lloyd Pease, who presided, referred to the fact that the profit available from the past year was the best in the history of the company. The net profit for the year ended September 30 last was £6,662 up at £33,561, and it was proposed to carry forward £26,308, out of which two years' excess profits duty was payable. (Capital £300,000.) During the past financial year the company had resumed its normal manufacturing business, but the proportion of general engineering work to power-gas work was greater than in the past. The position for the latter type of work is still unfavourable, partly owing to the very high cost of steel structures, and partly because the selling price of by-products has not kept pace with the cost of materials and labour. There has been a considerable development in the manufacture of small gas plants for producing gas for manufacturing and power purposes. Existing conditions, which are unfavourable to large undertakings, are favourable to the adoption by smaller industrial works of self-contained plants involving only a small capital outlay. The chief reason for this lies in the great increase in the cost of town gas and of fuel generally. The most suitable fuel for such small plants is coke or anthracite, of which there should be an abundant supply. Mr. Pease then reviewed the policy of erecting central electric "super-stations," and the relative merits of gas and electricity, adducing data which indicated that when town gas and coke or anthracite can be obtained, heat from gas will cost about one-third, and power from coke about three-quarters, of the cost of similar services from a central power station.

SCOTTISH OILS, LTD.

Sir Charles Greenway, in presiding at the statutory meeting of this company in London, on December 30, reviewed the objects of and the circumstances attending the formation of the company (this J., 1919, 358 R, 464 R). The offer of the Anglo-Persian Oil Co. had been accepted by 99 per cent. of the ordinary shareholders of the Scottish shale oil companies, and the reorganisation of the industry on more up-to-date lines is being proceeded with. The joint sale and distribution of the products of the Scottish industry, and also of the imported products is now in the hands of one organisation, the Scottish Oil Agency (Limited). The prosperity of the Scottish companies ceased with the termination of hostilities, owing to the reductions in the prices of imported oils, to which the Scottish products had to conform, and to the increased costs of production, due largely to the Sankey Award. The statement made by Mr. Adamson in the House of Commons (this J., 1919, 480 R) that the workers in the shale industry had not received the increase of 2s. per day under this award was entirely incorrect; this advance had entailed an additional burden on the industry of about £260,000 per annum. The addition of 6s. per ton to the price of coal involved a further cost to the company of about £210,000 per annum, and then the industry became hopelessly unprofitable. That was the position when the shale oil workers put forward their claim to a reduction in the hours of labour. The oil companies were compelled to refuse this claim, which would have meant an additional cost of about £200,000 per annum. After a short period of closing down the Board of the new company was able to arrive at a temporary arrangement with the representative of the workers, whereby the industry is still kept going, although not yet at full capacity. The position of the Board is that if the 7-hour day can be adopted without sacrificing a reasonable return on the invested capital, it will be conceded.

ENGLISH OILFIELDS, LTD.

The annual meeting was held in London on December 30, 1919. After a short address by the chairman, Sir James Heath, Bart., who stated that H. M. Petroleum Executive had agreed to give the company an exclusive licence to bore for liquid petroleum over a very extensive area, Dr. W. Forbes-Leslie, managing director, dealt at length with the recent activities of the company in regard to railway construction, equipment, brickyards, drilling operations and the character of the geological strata encountered on the property in Norfolk. *Inter alia*, a contract has been given for a by-product plant capable of dealing with 20 million cub. ft. of gas per 24 hours, with power to extend up to 30 million. An 11 ft. seam of shale has been struck containing a heart of torbanite material which yields on analysis 85—95 galls. of oil per day. The productive shale measures have been practically proved to be of greater thickness than 500 ft., and distinct evidence of the occurrence of liquid oil has been obtained. Deep-drilling operations have disclosed the existence of a mineral formation hitherto quite unknown in England, which, as it contains valuable metals and mineral substances, may prove to be of industrial importance.

Dr. E. Burnet, chemical adviser to the company, said that the Norfolk shales were very rich in volatile matter. Whereas the average amount of oil produced from Scottish oils was about 23 galls. per ton, that of the Norfolk seams was approximately 60 galls. Owing to the high organic content of the latter it was not found, as in Scotland, that the yield of ammonia varied inversely with the yield of oil. As much as 60—70 lb. of ammonium sulphate had been recovered from Norfolk shale, and the spent material from the retort should prove very valuable for making Portland cement. The breaking strain of a specimen of such cement was found to be 523½ lb. per sq. inch (the standard being 450), and a cement containing 75 per cent. of sand gave a breaking strain of 373½ lb., or 86 per cent. above the normal standard. The question of devising a suitable retort for distilling Norfolk shale had been under investigation, and the speaker hoped to be in a position shortly to publish the details of such a retort. Norfolk crude oil has a reddish-brown colour and a garlic odour; its specific gravity is 0·998, and on fractional distillation yields 10—20 per cent. of gasoline and 40—50 per cent. of kerosene, leaving a residue of about 40 per cent. boiling above 270° C. On distilling this residue up to 300° C., there is left a bituminous material of sp. gr. 1·170, m. pt. 82° C., of which nearly 90 per cent. is soluble in carbon bisulphide; this should be of great value as a binder in road-making. The average refining loss for Norfolk shale oil is estimated to be about 25 per cent., or a little more.

PERUVIAN GUANO SETTLEMENT.—The shareholders of the Peruvian Corporation have been officially notified that, subject to ratification by Congress, a settlement has been arrived at with the Peruvian

Government whereby the Corporation cedes the right to the Government to extract and export 762,872 tons of guano still due to it in return for payment of £3,501,488.

BWANA M'KUBWA COPPER MINING CO., LTD.

At the ordinary general meeting, held in London, on December 20, the chairman, Mr. R. Littlejohn, stated that the results of the trial treatment of the company's ore (in Rhodesia) by the Minerals Separation Company's process had so far been highly satisfactory. The results for 51 days' run were:—Tons of ore treated, 3,676; assay value, 5·3 per cent. copper; concentrates produced, 544 tons; value, 26·2 per cent. copper; recovery of copper contents of the ore, 78·1 per cent.; value of tailings, 1·46 per cent. copper. The trial test operations are being continued. The capacity of the plant is 100 tons of ore per day.

AMALGAMATIONS.—*British Glass Industries, Ltd.*, has entered into a contract to acquire a controlling interest in a number of firms manufacturing glass, including lamp-blown glass for scientific purposes.

The *Castner-Kellner Alkali Co., Ltd.*, has received an offer from Messrs. Brunner, Mond and Co. to purchase not less than 75 per cent. of the shares not already held by them, the payment to be made in ordinary shares of the latter company in the proportion of two shares for one Castner-Kellner share.

OFFICIAL TRADE INTELLIGENCE.

(From the Board of Trade Journal for December 25, 1919, and January 1, 1920.)

OPENINGS FOR BRITISH TRADE.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, Westminster, S.W. 1, from firms, agents or individuals who desire to represent U.K. manufacturers or exporters of the goods specified. British firms may obtain the names and addresses of the persons or firms referred to by applying to the department mentioned and quoting the specific reference number.

Locality of firm or agent.	Materials.	Reference number.
Australia	Galvanised iron sheets	*363/2/12
British India ..	Alcoholic beverages, preserved food	1
British West Indies	Alcoholic beverages, mineral waters	3
.. .. ..	Rubber	4
Canada	Electrical porcelainware ..	‡
.. .. ..	Glue	‡
Belgium	Asbestos	1279
Italy	Resistance wire for electric lamps, china insulators ..	12
.. .. ..	Chemicals, metals	13
Switzerland ..	Hides, skins, tanning materials, oil-seeds, lard, tallow, edible oils, mineral oils essential oils, paraffin wax, rubber ..	1290
.. ..	China, glass crockery	17
Palestine	Window glass lamp glasses, china	1291
Morocco	Perfumery inks	1295
United States .	Oils greases	1295
Peru	Oils, greases, rubber	1297

* Official Secretary, Commercial Information Bureau, Australia House, Strand, W.C. 2.
‡ Canadian Government Trade Commissioner, 73, Basinghall Street, E.C. 2.

MARKETS SOUGHT.—**A firm with head office at Novorossisk, South Russia, and branches in the Near East desires to get into touch with U.K. importers of old rubber overshoes, benzine from Gormaia, and potash for soap manufacture. These commodities are now ready for export at Novorussisk. [1288].**

TARIFF. CUSTOMS. EXCISE.

Australia.—A proclamation, dated October 15, 1919, prohibits the import of food containers the inner surfaces of which (A) consist wholly or in part of lead or zinc, or (B) consist of any metal alloy containing more than 10 per cent. of lead or zinc, or (C) are tinned with a metal alloy containing more than 1 per cent. of lead, or (D) contain enamel or glaze or indiarubber or guttapercha which yields lead on boiling with vinegar, or (E) contain more than ¼ of a grain of arsenic per lb. of alloy enamel or glaze.

Brazil.—The proposed revision of the customs tariff affecting paper, stones, earths, minerals, china, glassware and certain metals may be seen at the Department, 73, Basinghall Street, E.C. 2.

British Guiana.—An approved form of certificate of origin for goods entitled to admission under the preferential rate of customs duty is given in the issue for December 25.

France.—A new tax of 5 centimes per unit has been levied "for the development of foreign trade" on all articles subject to the statistical tax as from August 25 last. The tax does not apply to goods in transit through France.

Germany.—The decree relating to the payment of duties in gold is temporarily suspended.

Netherlands.—Export prohibitions have been temporarily raised from, *inter alia*, magnesia, hides, tanning materials, gums, matches, paper, fusel oil, iron and steel scrap, peat, tin-foil, "Haarlem oil," black lead, aloxite, alundum, emery, carborundum, and malt.

Portugal.—The full text of the decree for the control of exports and imports is set out in the issue for January 1. The provisions of the decree entitle the Government to double the present import duties and surtaxes on all articles in the schedule annexed to the Decree No. 5612 of 1919.

South Russia.—The revised list of goods which may be imported free of Customs duty includes malt, starch, vinegar, manure, animal fats and oils, hides and skins, copra, medicinal plants, stone, asbestos, acid-proof stoneware, raw rubber, Stassfurt salts, sulphur, antimony, boric acid, borax, ammoniacal preparations, saltpetre, soda, potash, chloride of lime, certain acids and chemicals, medicinal and pharmaceutical preparations, phosphorus, ether, chloral, chloroform, opium, vegetable oils, glycerin, tanning materials, dyes, certain pigments, some metals, ores and alloys, vegetable fibres and margarine.

Spain.—The decree for the control of the manufacture and sale of pharmaceutical specialities may be seen at the Department, 73, Basinghall Street.

TRADE NOTES.

BRITISH.

Forthcoming Industrial Fairs.—*United Kingdom.*—The British Industries Fair, 1920, organised by the Board of Trade, will be held simultaneously in London, Birmingham, and Glasgow from February 23 to March 5. At the London fair (Director, 10, Basinghall Street, E.C. 2), to be held at the Crystal Palace, the exhibits will include glassware of all kinds, china and earthenware, scientific instruments, photographic appliances and requisites, drugs and druggists' sundries. There are 2½ million cubic feet of stands, and the exhibition will be the largest ever held in this country. The Bir-

mingham fair (Secretary, The Chamber of Commerce, 95, New Street) will include exhibits of paints, colours, varnishes, and painters' requisites, tubes in copper, lead, brass, and steel, pipe fittings, etc. The Corporation of the City of Glasgow (General Manager, Kelvin Hall of Industry, Glasgow) will show, amongst other goods, chemicals (light and heavy), and domestic chemical products.

Bâle.—It has been arranged to hold the fourth annual sample fair from April 15 to 29 next.

Bandoeng.—An industrial fair, under private auspices, will be opened at Bandoeng, Netherland East Indies, on May 20, 1920, and will last for two or more weeks. Among the eight groups of articles is "Chemicals and Nursery Appliances."

Barcelona.—From April 2 to 12, inclusive, an international business organisation exhibition will be held in the Palaccio de Bellas Artes, and will be continued annually. The Barcelona international fair will be held from May 15 to 30.

Bordeaux.—The period fixed for the fourth annual trade fair is June 5 to 20.

Brazil.—The British Chamber of Commerce at Sao Paulo has organised a series of British industry fairs in order to stimulate the importation of British manufactures into Brazil. The fairs will be open until February 28, 1920.

Brussels.—The municipality of Brussels has organised an international commercial fair, to be held in that city from April 4 to 21 next. The exhibits will comprise chemical industry and products, pharmaceutical products and drugs, leather, ceramics, glassware, metals, and photography. (Executive Committee, Grand Place 19, Brussels.)

Johannesburg.—The annual mining exhibition, held by the Chemical, Metallurgical and Mining Society of South Africa, will be held at the School of Mines, Johannesburg, from January 21 to 31.

Leipsic.—This fair is in future to be held in two sections—the general sample fair from February 29 to March 6, and the technical fair from March 14 to 20, 1920. The former will include exhibits of glass and ceramics, metal goods of all kinds, goods of leather, rubber, cork, and celluloid, soaps and perfumes, chemical-pharmaceutical wares, optical goods, etc. At the technical fair will be shown machinery, tools, and apparatus of all kinds, factory equipment, safety appliances, measuring instruments, balances and weights, optical instruments, chemical plant, etc. Thus chemical industry will be represented in both sections, the general idea being that materials required for the household shall be shown at the general fair, and those which supply technical needs, at the technical fair. Associated with both fairs will be an exhibition of raw materials and semi-manufactured goods.

Lyons.—The international (spring) fair will be held from March 1 to 15. (British agent: A. Rousset, 69, Wood Street, E.C. 2.)

Milan.—The 1920 international fair will be open from April 1 to 15. Only Allied and Neutral exhibits will be shown. There is said to be a good market for chemicals in Italy. It is proposed to hold the fair twice yearly, in the spring and autumn.

Paris.—An exhibition of samples is to be housed permanently in the Musée Commercial Universal in Paris, where space has been allotted for 1200 exhibits. Branches are to be established in Italy, Spain, Belgium, Switzerland, Poland, and the Far East.

Sweden.—Fairs are to be held this year in Sundsvall and Malmo. A new organisation is planning a fair to be held in 1921 and thereafter in Gothenburg.

Utrecht.—The fourth annual national industries fair will be held from February 23 to March 6. (General Secretariat, Jaabans, Administratiegebaw, Vredenburg, Utrecht.)

FOREIGN.

United States Foreign Trade in Glycerin.—The trade of the United States in glycerin has been completely revolutionised by the war. Annual imports ranging from 10,000 to 20,000 short tons prior to 1914, dwindled to 500 tons in 1919, when not only was sufficient glycerin produced for home consumption but 10,500 tons in 1918 and 6,500 tons in 1919 were exported. No accurate data are available concerning the production of glycerin in the United States since the census taken in 1915, but the estimated output in 1917 was 35,000 tons, crude. The world's total output before the war was 40,000 tons. Figures representing imports of glycerin into the United States have been separately enumerated since 1884. The record quantity of glycerin imported was 20,590 tons in 1910. In the following table the total annual imports for a number of years are given in tons, together with the average price per pound:—

Fiscal year ending June 30.	Short tons.	Average price per lb.
		s. d.
1884	2,916	0 5½
1894	4,160	0 3
1904	15,539	0 4
1914	18,205	0 6
1915	8,810	0 6
1916	5,310	0 10
1917	2,061	1 3½
1918	937	1 9½
1919	585	1 3½

The United Kingdom and France were the leading suppliers of glycerin up to 1916, when exportation ceased, to be resumed in 1919, when the former exported 51 tons. The following table gives the exports of glycerin from the countries named to the United States, expressed in percentages of the total imports of glycerin for the year:—

Fiscal years ending Jun 30	Austria-Hungary.	Belgium.	France.	Germany.	Italy.	Netherlands.	Spain.	United Kingdom.
1884	1·6	1·0	60·6	21·5	1·5	1·7	—	10·9
1894	0·1	12·0	56·1	2·6	9·2	0·6	15·7	1·9
1904	0·6	4·4	46·1	1·8	5·7	5·6	4·3	24·5
1914	0·7	7·3	30·8	5·2	2·4	7·0	4·6	29·0
1915	0·7	2·9	22·5	0·3	0·9	4·5	0·9	44·7
1916	—	—	16·5	—	—	8·7	24·0	8·1

Glycerin made in the United States was exported to 54 countries during the fiscal year 1918 (the first year for which it was separately shown in the export schedule), 91 per cent. of it going to Europe. Of the total 10,073 short tons exported to Allied countries, 9,443 tons went to Italy, 718 tons to Canada, 104 tons to England, 50 tons to France and 40 tons to Japan. The following table shows the amount and destination of glycerin exported during the year ended June 30, 1919:—

Destination.	1919. Tons (short).	Per cent. of total exported.
United Kindgom ..	3,420	52·5
Japan	1,258	19·8
Italy	857	13·2
Canada	511	7·8
Norway	131	2·0
Argentina	72	1·1
Cuba	44	0·67
China	33	0·55
British India	21	0·33

Total to all countries, 6,509 tons, valued at $0,833,432.

There was a striking decline in the export trade during the last six months of the fiscal year as compared with the first half, *viz.*, 1,350 tons, against 5,159 tons.—(*U.S. Com. Rep., Nov.* 10, 1919.)

REVIEWS.

THE PROFESSION OF CHEMISTRY. *By* RICHARD B. PILCHER. *Pp.* xi. + 199. (*London: Constable and Co., Ltd.*, 1919.) *Price* 6*s.* 6*d. net.*

Although intended by the author to provide boxroom chemists, their parents and schoolmasters with information regarding the profession it is their ambition to enter, this book will be read with very considerable interest by chemists themselves. The latter will probably be astonished to find that there is so much to say, but they will agree that nobody is better qualified to say it than Mr. Pilcher, whose long and loyal service to the Institute of Chemistry commands the gratitude and admiration of the whole profession.

The opening chapter, on Preliminary Education, automatically leads to the inevitable comparison between classics and science as instruments for cultivating the mind, and the author crystallises our creed in the following words: "The demand for more science in general education was not necessarily associated with the idea of neglecting classical study and literature, but was made in order to secure that all classes of the community should be given the opportunity of knowing sufficient of the fundamental principles of mechanics, physics, chemistry and biology to enable them to appreciate their value in the affairs of everyday life." It is this opportunity of a balanced education which has been denied us in the past by our classicists who, in accusing us of "too early specialisation," ignore the fact that it is they themselves who have hitherto specialised most unblushingly. It is probable that, in consequence of this, not one per cent. of parents travelling on the Underground each day could give their sons a coherent sketch of the energy transformations involved. Fewer still, although we are all engaged from breakfast to bed-time in organic chemical operations of the greatest subtlety, have the slightest conception of the food-materials which they assimilate. It is the yawning gaps in our understanding of everyday life typified by these examples, acting on minds eager for distraction, which stimulate the demand for ephemeral literature; how much happier and better the world would be if only schoolmasters realised how little nature-study need be given to enable boys and girls to prefer, for instance, those delightful essays comprised in "Science from an Easy Chair" to "Snappy Snips."

Basing his hopes upon an interesting historical discussion of the words chemist, druggist, apothecary and pharmacist, the author looks forward with patience and moderation to the day when enlightened public opinion will remove the present absurd anomaly from our commercial nomenclature, a misfortune which has exerted incalculable influence in retarding the appreciation of chemistry in Great Britain. Pharmaceutical practice represents a communal factor much too necessary and honourable to require the supposed assistance of a misnomer, and a pharmacist cannot be a better pharmacist for calling himself a "cash chemist." There is at least one pharmacist in London who describes himself as a "continental chemist"; probably his claim to continentality is more easily imagined than stated.

The chapter on Professional Training is a comprehensive guide to the various institutions at which the study of chemistry may be pursued, and should prove extremely valuable to the aforementioned parents and schoolmasters, who will also scrutinise with some anxiety the Prospects and Conditions of Practice. Becher's description of chemists as "a strange class of mortals impelled by an almost insane impulse to take their pleasure among smoke and vapour, soot and flame, poison and poverty," is not entirely out of date. Hitherto there has been one singular resemblance between Holy Orders and the practice of chemistry—the practitioner is supposed to receive part payment from his temperamental delight in the subject itself. Whilst there may be ethical objection to substantial fees for spiritual guidance, there is no similar obstacle to the due recognition of chemical advice, and it is deplorable that this is still incompletely appreciated because the responsibility of the chemist is not realised. On this point the author makes the following appropriate observation: "The public analyst who makes a mistake suffers in prestige. In the law, judges may frequently express the opinion that the litigants have been badly advised; for instance, that a case should not have come into court. This is a matter between solicitor and client. In medicine, eminent physicians may make a faulty diagnosis, and scarcely anyone hears of it. In architecture mistakes can often be rectified before the building is completed. The public analyst, however, whose practice as such consists largely of investigations bringing usually but a small return, is answerable as a public official, and his reputation is at stake on any lapse from accuracy, though it may be the result of an accident—for instance, through a confusion of samples, or lack of uniformity of a sample unevenly mixed."

The book includes a long and admirable chapter on Industrial Chemistry, and a shorter one on the relation between Chemistry and the State. It is a thoroughly commendable work, carefully written, full of sound common-sense presented in an attractive manner.

M. O. FORSTER.

PRACTICAL LEATHER CHEMISTRY. *By* A. HARVEY. *Pp.* 207. (*London: Crosby Lockwood and Son.* 1920.) *Price* 15*s. net.*

The author describes his work as "a handbook of laboratory notes and methods for the use of students and works chemists," and as such the book will be useful.

It consists of twenty chapters, each chapter dealing with the method of analysis of each of the important substances used in connexion with tanning and leather dressing. The chapters deal with the analysis of water, lime, alkaline sulphides, the estimation of nitrogen, analysis of used lime liquors and limed pelt, deliming agents, single and two bath chrome liquors, egg yolk, soap, oils, fats and waxes. In this chapter a list is given of the most important constants in connexion with the oils used for leather dressing, together with some information as to the interpretation of the values. A chapter dealing with the qualitative reactions of the various tannins gives some useful and simple tests for the better known substances. The quantitative methods of tanning analysis, including both the iodide and Löwenthal processes, as well as the official method, are also described; and a comprehensive list of the average analysis of most tanning materials is provided in tabular form. The analysis of used tan liquors, leather analysis, finishing materials, natural dyestuffs and coal-tar dyes are considered in subsequent chapters, and some useful tables are given in the appendix.

Mr. Harvey does not attempt to deal with either the principles underlying the methods of analysis, or the interpretation of results, but confines himself to outlining the most common methods for the analysis of the material under discussion, giving in nearly every instance equations and the detailed method of calculating results with typical examples. In fact, a considerable amount of space is taken up by examples of calculations which, in a book of this nature, might have been omitted.

The volume contains just a little more information than the "Leather Chemists' Pocket Book," but at the same time is not sufficiently complete to

make it a full laboratory text book. It will, however, be of considerable use to every chemist in a leather works, and also to students, although the latter will not be able to use this volume except in conjunction with larger works giving alternative methods.

Mr. Harvey is a clear writer, and describes each process in simple and clear language. The addition of blank pages bound between each chapter for notes will be found useful. There are not many illustrations, but those which are supplied are excellent and simply prepared.

When the author comes to revise this volume for a second edition it will be well for him to consider whether he should not cut out the unnecessary examples of calculations and so make it into a pocket book or, on the other hand, the volume could be enlarged with advantage, thus bringing it up to the standard of an analytical text book, for which, at the present time, there is a distinct want.

The book is well printed and well got up, and is quite equal to this well-known publisher's usual standard.

J. Gordon Parker.

Commercial Oils: Vegetable and Animal. *With special reference to Oriental Oils.* *By* I. F. Laucks. *Pp.* 138. (*New York: John Wiley and Sons, Inc. London: Chapman and Hall, Ltd.*, 1919.) *Price 6s. net.*

The primary object of this little book is to give those connected with the oil trade a description of the nature of oils, their uses, and the methods used in their examination, with sufficient details to enable a non-technical reader to understand the meaning of an analysis. On the whole the author has succeeded in this object, although in some places the explanations of technical points have been omitted. For example, on p. 34 mention is made of the "yield of hexabromides," but no description is given of the meaning of the term. Incidentally it may be mentioned that the application of the term to glycerides is misleading. The insoluble bromides separated from certain oils are probably the bromides of mixed glycerides and are certainly not linolenic hexabromide. Another omission to be noted is in connexion with rancidity. It is a matter of great importance to check the action of enzymes prior to expression of oils, and the meaning of enzymic action might therefore have been dealt with in a non-technical manner.

The value of this book for English chemists is that it includes in a form convenient for reference the tests and specifications drawn up for different oils by the United States Army, the Chicago Board of Trade and various commercial associations. There is also a useful chapter on the methods of sampling oils. The constants of Oriental oils typical of those now being imported into the United States were determined in the author's laboratory and are given here in tabular form. These differ very considerably from recorded values for the same kinds of oils of different origin, and it is cogently suggested that new standards should be fixed for these oils. In the short tables in the text the usual upper and lower limits for the values of oils are given, and exceptional values are excluded.

C. A. Mitchell.

THE REPORT OF THE NITROGEN PRODUCTS COMMITTEE.

H. A. HUMPHREY.

No more important scientific report has ever been published by the Government than that of over 350 pages presented in May last to the Minister of Munitions by the Nitrogen Products Committee of the Munitions Inventions Department. The Committee, composed of some of our most able scientists and technical men, each an expert in one or more subjects, has spent three years in collecting information on the nitrogen situation from all sources, many of which would not otherwise have been accessible, and has tabulated, weighed, adjusted and adjudicated, with the sound judgment derived from wide experience. In thus bringing expert knowledge to bear on the questions involved, the Committee has contributed the most up-to-date and authoritative information on the nitrogen problem in the form of a report, which by reason of the care bestowed on its final preparation by those who are noticed in the concluding remarks therein, is a model of clarity and, typographically, sets up a new high standard which might well be followed by all Government Departments.

The responsibility resting on the Committee was a heavy one. If its findings and recommendations are not accepted and acted upon, there will be a still heavier responsibility on the Government.

The issues raised in the report are vital to the interests of the nation. There are hopeful prospects mixed with grave warnings, but many will be disillusioned of long-cherished ideas. The Committee has mapped out certain lines of action which the nation can only refuse to follow at its great peril, and it is for readers of this Journal to do their full share in seeing that the utmost possible good shall result from the valuable work done by the Committee.

The present article is an attempt to throw into relief some of the salient features of the report and to comment briefly on them.

Nitrogen products are chiefly of importance to the world because, without them, the crops on which we live could not be grown. Nitrogen combined as nitrate and sulphate forms the basis of fertilisers for all plant growth and therefore, if indirectly, of practically all food. Nitrogen is also an essential constituent of nearly all our explosives and is therefore the basic weapon with which modern war is waged. Without an abundant supply of nitrates we should have lost the war. In fact, had the enemy been capable of maintaining a fleet to cut off our supplies of Chilean nitrate we must have been defeated. At one time the sinking of ships bringing nitrate to this country was serious enough to force us to start building a factory to make nitrates synthetically in this country. Germany was making synthetic nitrates before the war, developed her manufacture during the war, and would have been reduced to impotence at a much earlier date if, by synthetic means, she could not have kept pace with her requirements for nitrogen products. It is an amazing fact that before the armistice was signed Germany was producing synthetic ammonia at the rate of 650 tons per day, approximately equivalent to 500,000 tons of ammonium nitrate per annum! Contrast this with the fact that the only synthetic ammonia produced in this country was a few pounds weight per day—the product of experimental apparatus at University College, London. Under present conditions, if we had the misfortune to be at variance either with Chile or with a country capable of preventing supplies of Chilean nitrate reaching England we might be compelled into acquiescence because we should have insufficient explosives to warrant a threat to use force.

Let us return, however, to the question of combined nitrogen and see first how matters stood before the war, both as regards the world position and the position of this country, and in doing so we may remember that 70 per cent. of the total output is required for fertilisers.

The world's consumption of Chilean nitrate was naturally greater than that from any other single source, because in the vast deposits of sodium nitrate in Chile there was available a source of supply only needing to be dug out, purified, and shipped.

In 1903 the world's consumption was 1,429,150 tons. In 1913 it had risen to 2,464,540 tons, showing an increase of 1,035,390 tons per annum in a period of 10 years. Of this amount the British imports were in 1903, 116,715 tons, and the price was £9 10s. 10d. per ton; in 1913, 140,926 tons, and the price per ton was £11 1s. 8d. In 1917 the price rose to £27 per ton! British imports during the war were, of course, much larger, and indeed were only limited by the possibility of sparing ships (from a greatly depleted tonnage) urgently needed for bringing food and for transporting men and material. The Allies collectively imported over 2,000,000 tons of Chilean nitrate in 1915, and nearer 3,000,000 tons per annum in 1916 and 1917.

Germany imported 833,112 tons in 1913 or, say, six times our own consumption. During the war, thanks to our fleet, her imports were *nil*, yet she managed entirely to replace the loss and at the same time to establish an industry of the utmost post-war value.

The next nitrogenous fertiliser in order of importance is sulphate of ammonia, of which the world's production prior to the war was, in 1903, 540,200 tons per annum; in 1913, 1,389,810 tons per annum, showing an increase of 849,610 tons per annum in 10 years, during which there was a steady rise every year. The price was variable, and ranged from £11 5s. to £14 7s. 9d. per ton in England. Seeing, however, that sulphate was sold in this country 22 years ago for £7 10s. per ton, the general upward trend is evident. During the war it rose to £17 10s. per ton, and would have soared higher but for Government control.

Of the above quantity of sulphate, Great Britain in 1913 produced 439,540 and Germany 549,558 tons. Ammonium sulphate is mostly derived from gas works and coke ovens, and both countries did all they could to increase their output from these sources during the war. Owing to adverse circumstances the British increase was quite small. Germany, however, succeeded in raising her by-product output to about 700,000 tons. Greater attention was paid to the simultaneous extraction of benzol and toluol, because both were required for explosives, the latter being used for making TNT (trinitrotoluene). It should however be noted that much of the TNT we used during the war was derived from the distillation of imported light oils. Some people still think we fought the war on explosives made from by-products of the gas industries; that is quite a mistake, although such products played a most important part.

Before the war Great Britain not only supplied her home requirements for sulphate, but in 1913 exported some 325,000 tons. At one stage of the war this valuable export trade had to be stopped because the ammonia was needed for warlike purposes and to meet the increased agricultural requirements. The British export trade was the largest of any country and was rapidly growing. In the ten years 1903—1913 our exports of sulphate doubled, and, if we are to continue to hold our

markets abroad, it can only be done by manufacturing cheap synthetic ammonia.

Reserving comments on the above facts, let us examine the Committee's figures for the production of synthetic nitrogen products. Omitting, for reasons of space and not for lack of interest, all reference to partly developed processes, it will be assumed that readers are familiar with the established methods of nitrogen fixation. The chief methods and their primary products are:—The arc process, producing nitric acid; the cyanamide process producing calcium cyanamide; and the Haber process, producing ammonia. As the products differ, it is desirable to compare the processes on the basis of their combined nitrogen content. The commercial products have nitrogen contents approximately as follows:—Nitric acid (as 100%) 22·2%, ammonia (liq. sp. gr. 0·88) 29·3%, calcium cyanamide 17·5%; and for comparison we may add Chilean nitrate 15·6%, and ammonium sulphate 20·2%.

The three leading processes differ greatly in their requirements for power and in the capital cost of the respective plants, as will be seen from the following table:—

Process.	Kw.-Year per ton of combined nitrogen.	Primary product.	Capital cost per ton of combined nitrogen per annum.	Cost of producing one ton of combined nitrogen.	Cost of producing one ton of primary product.
			£	£	£
Arc process ..	8·41	Conc. nitric acid	178·4	51·8	11·51
		Nitrate of lime..	178·6	58·8	7·65
Cyanamide Process ..	2·13	Calcium cyanamide	45·4	24·0	4·69
Haber process	0·42	Ammonia ..	54·0	20·6	17·0
		Ammonium sulphate ..	68·7	29·3	6·03

Metric tons are used in the above figures, and it is assumed that steam power costs £3·75 per kw.-year. The figures are on a pre-war basis and paragraph 32 of the original report should be consulted for details of the charges included. Similar figures, based on water power, are also given in the report.

It is evident that in a country like ours, where no large water-power schemes exist, the arc process may be practically ruled out, leaving as suitable for development the cyanamide and Haber processes. Apart from the fact that cyanamide contains less nitrogen than ammonium sulphate, there is little doubt that the latter is the better fertiliser for most purposes. Both processes should be established in this country, but, all things considered, the Haber process appears best suited to British requirements.

The Haber process differs from all manufacturing processes established in this country in that it involves the use of red-hot gases at the very high pressure of 150—200 atmospheres. Further, it needs very pure hydrogen and nitrogen. Unless the hydrogen is pure, the catalyst, which brings about the direct union of the two gases to form ammonia, becomes poisoned and ceases to be active. But for these facts the process would be incomparably superior to all others. However, the difficulties have been overcome in Germany, where the process is now established on an enormous scale. Single catalyst units producing 20 tons per day are in regular operation and, as already stated, some 650 tons of ammonia have been produced per day, and from two works only. This enormous output has been made under the pressing necessities of the war, but it menaces the world's markets after peace has been concluded.

The development of the Norwegian nitrate industry was so hindered during hostilities, that although the war produced marked change in the form of the products yet the total output remained almost stationary. Thus there was a decrease in the production of nitrate of lime and of calcium cyanamide and an increase in ammonium nitrate, the output of the latter rising from 9167 tons in 1913 to 63,578 tons in 1917.

Both France and Germany largely increased their plants for cyanamide products during the war, as the following figures show:—

Country.	Cyanamide produced in 1913.	1917.
France	7,500	100,000 tons
Germany	24,000	500,000 tons

But the most significant growth in Germany's nitrogen industry is in the Haber process output, which rose from 30,000 tons (as sulphate) in 1913 to 500,000 tons in 1917, and the plant capacity is now probably over 800,000 tons.

The annual capacity of the German plants may now be placed at the following approximate figures:—

From by-product ammonia ...	700,000 tons (as sulphate)
From cyanamide process ...	500,000 tons (as cyanamide)
From Haber process	800,000 tons (as sulphate)
Total	2,000,000 tons of products

The actual German production in 1917 was 1,600,000 tons of products containing 320,000 tons of combined nitrogen, or say 28 per cent. of the world's post-war capacity, including Chilean nitrate. During the war the world's capacity for producing nitrogen products has increased by over 40 per cent.

What relation have such figures to possible peace requirements? It is rather astonishing to find that the world's increase in productive capacity over the war period does not appear to be greater than would have been the case under normal conditions had the ordinary pre-war rate of increase been maintained, for the total requirements were doubling every 10 years. Over-production therefore need not be seriously feared. What concerns us intimately and vitally is: Where will our Empire stand with regard to its own production and consumption?

The United Kingdom alone is expected to require for agricultural purposes combined nitrogen equivalent to half a million tons of ammonium sulphate per annum, an increase of nearly 150 per cent. compared with pre-war figures. Our farmers use little more than half the chemical fertilisers per acre as compared with German practice, and the larger amount is undoubtedly a paying proposition at pre-war prices.

Then there is our export trade, valued before the war at £4,000,000 per annum, which should be greatly increased. In order to render the United Kingdom independent of imported nitrogen and at the same time to enable a large export trade to be maintained, the total home production of ammonia nitrogen alone would have to be increased to 125,000 metric tons per annum to satisfy the immediate visible demand, and to 182,000 tons per annum to meet the estimated demand of the near future. In other words, the present scale of production would require to be augmented at an early date by the equivalent of about 155,000 tons of ammonium sulphate per annum, and by 440,000 tons per annum in the near future, corresponding to increases of about 33 and 100 per cent. respectively upon the 1917 output.

We had markets in neutral countries which Germany will try to capture, and there are our own grain-growing Dominions and Colonies to be

supplied. Is Germany to capture this trade, or a part of it? It is not easy to answer this question, but evidently it depends on policy and prices.

Leaving matters of policy to others, let us turn to prices, which are dealt with in considerable detail in the report. We have already seen that the price of nitrogen fertilisers has been steadily rising. This country produces its sulphate almost entirely from by-product ammonia, and, based on the market price of crude ammonia liquor for 1911 to 1913, it costs £13 6*s.* to produce a ton of sulphate. Compare this with the Haber cost figure of £5·67, and one sees at once the great possibilities of the Haber process. If the prices ruling in May, 1919, be taken the comparison is £17 10*s.* and about £11.*

From these figures certain outstanding conclusions may be drawn:—

(1) There is room for a large increase in the output of nitrogen products in this country.

(2) It is of the greatest importance that the cost of production should be as low as possible so that the use of nitrogen products may be stimulated and we may retain and extend our export trade.

(3) Only by manufacturing ammonia by the cheapest synthetic process can we meet the requirements of (2).

(4) The price of by-product ammonia must fall to meet competition.

With reference to the question of international competition, cheap synthetic nitrogen processes will control 30 per cent. of the world's supply of fixed nitrogen in the near future. How will that affect us and others? Possibly the price of sulphate of ammonia will have to drop to the lowest level hitherto recorded, say to £7 10*s.* per ton, equal to £37 per ton of combined nitrogen.

Calcium cyanamide can be made abroad where cheap water power is available at, say, £4—£5 per ton. Allow for packages, etc., and we have a factory cost of say, £5·75 per ton, equal to £29 per metric ton of combined nitrogen at the factory.

The trade in Chilean nitrate will suffer unless the Chilean export duty is so reduced and the working methods of extraction so improved that the product can be produced for about £7 10*s.* per ton, equal to £47 per ton of combined nitrogen.

Nitric acid is likely to be produced in Norway at less than £8 per ton (calculated as 100%), but there will be the difficulty of transport to be faced. In Great Britain nitric acid cost before the war £22 per ton, whereas it could have been made here, by the oxidation of cheap ammonia, at £11 per ton nine months ago.

Nitrate of lime and sodium nitrate, made by the arc process with cheap water power, may be able to compete with Chilean nitrate even allowing for a substantial fall from the pre-war price of the latter product. The cheap nitric acid of the arc process may enable combined nitrogen in the form of these products to be produced at £30 per metric ton.

To sum up, the Haber and cyanamide processes are likely to determine prices in the future and may well bring them down to the level of £7 10*s.* per ton for ammonium sulphate and £6 10*s.* for cyanamide.

Incidentally the dangerous rise in the price of coal may be mentioned with reference to the possibility of producing cheap power for synthetic processes in this country, for a rise of only 2*s.* 6*d.* per ton, from the assumed basis of 7*s.* 6*d.*, increases the cost per kw.-year from £3·75 to £4·51, *i.e.*, an increase of over 20 per cent.

These considerations bring us back again to the Haber process, and we are led to ask what is being done to establish the process in this country. The answer is satisfactory up to a point, for the Committee is able to direct attention to the organisation it created under the Munitions Inventions Department, the staff it appointed to carry out a programme of experimental work, and to the splendid results achieved. Under Dr. J. A. Harker three principal branches of investigation were formed to deal respectively with ammonia synthesis, ammonia oxidation, and the production of gases suitable for the synthesis of ammonia. The heads of these three branches were Lieut. H. C. Greenwood, Capt. J. R. Partington, and Capt. E. K. Rideal, and they have been ably assisted by others who all deserve to be named individually.

The experimental work has mostly been carried out at University College, London, in laboratories made available by the willing co-operation of the Provost and the directors of the Ramsay Laboratories. Other experiments have been conducted at King's College and at gas works able to provide special facilities. No more scientific, thorough, or successful programme of work has ever been carried through by any Government Department, and the highest praise is accordingly due to the Munitions Inventions Department and its staff.

It took Germany over five years to develop the Haber process, and its secrets were most jealously guarded; the research staff of the Munitions Inventions Department, a small but brilliant body of experts, worked out the whole process in half that time and in some respects is ahead of Germany to-day as regards efficiencies obtained. Valuable discoveries, covered by over twenty patents, have been made during these investigations, and although the opportunity of putting the results into actual commercial use is still awaiting decision, yet this country has been brought abreast of German results so far as semi-technical work is concerned.

At a time when difficulties were increasing rapidly and the transport of Chilean nitrate to this country was becoming more and more precarious owing to shortage of ships and sinkings by enemy submarines, the Department of Explosives Supply decided that the work done by the Munitions Inventions Department was sufficiently complete to warrant the erection of a large factory in Durham to manufacture 60,000 tons of ammonium nitrate per annum by the Haber process. The synthetic ammonia stage was to be followed by the oxidation of part of the ammonia (by the catalytic method) to nitric acid, and a combination of the other part with the acid to yield ammonium nitrate.

A site was chosen at Billingham, some 3½ miles N.E. of Stockton-on-Tees, and work was started; but lack of high priority, and the subsequent drain on the D.E.S. staff for the still more urgent production of poison gas in overwhelming quantities, prevented the work from being completed. When the armistice was signed building operations had not advanced very far, although a considerable amount of plant had been ordered. Whatever decision may ultimately be reached with regard to the future of this development it is a matter of vital importance that this beginning of a new industry in our country should not be allowed to drop. If it is not to be revived as a Government measure, then it should proceed as a private enterprise.*

One of the features of the war was the use made by us of ammonium nitrate explosives. This material constituted by far the greater weight

* Recent advances in the cost of coal and labour have seriously affected the power problem and production costs generally. In this article, as in the Report, estimates of costs have for the most part been based upon pre-war figures.—ED.

*Early in November, 1919, the Secretary of the Ministry of Munitions announced that the Government had decided to leave further development to private enterprise, and that the Minister of Munitions was prepared to receive offers for the acquisition of the partly constructed factory from persons or firms in a position to develop successfully the fixation of atmospheric nitrogen.—ED.

of the total explosives used. In peace time, and on a large scale, it should be possible to produce a ton of ammonium nitrate *via* Chilean nitrate for £30. It actually cost us, under war conditions, double this figure. If we had possessed Haber plant sufficient to meet our needs for ammonium nitrate, the cost per ton, even assuming as an extreme case twice the pre-war basis, would have been £22 per ton—a saving of £38 per ton. At only 400 tons per day (and we used more) we should have saved nearly £1,000,000 every two months and could have used our Chilean nitrate transport fleet for other purposes.

Again, we used imported Chilean nitrate to make the enormous quantities of nitric acid used in the manufacture of other explosives, *i.e.*, for propellants, TNT, etc. Nitric acid so produced cost us about £30 per ton (100%). By the process intended for Billingham it could have been made at half the cost; indeed, the calculated pre-war basis was as low as £9 10*s.* per ton of acid.

At the time and under the conditions then existing, the Explosives Department had no choice and was obliged to base its production on imported nitrates, but never again must that occur. It is essential to national safety that we should be independent of imported products required in any future war. The United States, France, Italy and Japan all recognise that the same necessity applies to them individually, and they are taking the necessary steps by establishing synthetic processes. England must lead the way and not lag behind.

There has been a close *liaison* between the Allies over all technical war matters, and the greatest admiration has been expressed at the valuable work done by the British scientists and technical men of our Government staffs. The United States has decided to have a permanent organisation to continue technical work of this kind under Government auspices and cordially hopes we shall do the same. Unfortunately for such a prospect, however, the Munitions Inventions Panel, of which the members of the Nitrogen Products Committee formed a strong section, was disbanded even before the Committee's far-reaching and influential report was published! Truly we are a wonderful nation, and it is not surprising that we puzzle our Allies.

One of the most important sections of the Nitrogen Products Committee's Report deals with the cost of production of electric power in this country, chiefly in connexion with power plants operating on continuous full load as required for chemical factories such as those producing synthetic ammonia. For the first time we have an authentic review of all the systems of power production available for use on a large scale, and the numerous charts and tables given in the report are of the greatest interest. Some of the results will come as a shock to holders of pet ideas on the subject. We are all familiar with the notion that as nitrogen products can be obtained from the destructive distillation of coal, and still better by its gasification in producers, that all coal for power purposes should be submitted to one or other of these processes, or that distillation should be followed by gasification of the resulting coke. Experts in these matters were already aware to what extent the promises based on these ideas would have to be discounted, but in this report we have the facts put to the test of cold, unbiassed figures. Every technical man interested in power production will closely scrutinise these tables and charts for himself, for they cannot be briefly summarised. Some broad conclusions can, however, be stated.

One kilowatt-year can be obtained at the switchboard of a 100,000 kw. station with:—

I. Direct coal fired boilers and steam-turbo-generators for an expenditure of 6·5 tons of coal.

Using other systems to generate the steam by gas-firing and giving the same electrical output (1kw.-year) the coal consumptions would be as follows:—

II. High temperature carbonisation of coal: 9·4 tons.

III. Low temperature carbonisation of coal: 8·6 to 9·0 tons.

IV. Complete gasification of coal in recovery producers: 12·3 tons.

V. Low temperature carbonisation of coal followed by complete gasification of the resulting coke in recovery producers: 14·3 to 16·2 tons.

The cumulative effect of the thermal losses in the various stages of a complete power scheme utilising by-product recovery processes is such that the total consumption of coal becomes from 32 to 150 per cent. *in excess of that required for direct firing.*

The pre-war cost per kw.-year with the direct coal-fired station and coal at 7*s.* 6*d.* per ton is taken at £3·75, full details being given to show how this figure is arrived at. Assuming certain yields of by-products, and their probable market value, the revenues and working expenses for the other systems (Nos. I. to V.) are set out in full detail in a number of tables.

The capital outlay in each case is given as follows, per kilowatt (available) of plant:—

I. Direct coal-firing	£10·26
II. High temperature carbonisation system ...	£16·45 to £20·63
III. Low temperature carbonisation system ...	£17·04 to £17·35
IV. Complete gasification in producers	£19·20
V. Low temperature combined scheme	£28·79 to £31·82

Therefore the *additional* capital expenditure in applying a by-product recovery process to a large electric power station represents a capital increase of from 60 to 200 per cent. according to the system adopted.

Still, in spite of the obvious disadvantages due to greater coal consumption and working and capital charges, the financial results are not so bad, and may even be favourable in certain cases, *provided coal is cheap.* With coal at 10*s.* per ton there is, compared with direct firing, a loss in cases II. and IV., a gain in case III., and either a gain or loss in case V., according to which of two low temperature schemes is adopted. Naturally the results will vary with coal prices and with the prices obtained for the by-products, but the tables and charts in the report show clearly how the ultimate cost of the electric energy is related to such variations. The financial results with direct coal-firing are less sensitive to changes in the price of coal than are the results of any other schemes.

From the national point of view the question is: Are we justified in using from 32 to 150 per cent. *more* coal in order to employ a process which yields us the by-products from the coal used? If coal at the central station is going to cost anything approaching £1 per ton then the whole problem will settle itself, for carbonisation and gasification will not pay and dear coal will have killed a promising development. If we ever have the great advantage of cheap coal again then carbonisation and gasification processes will require close investigation, especially if the possible developments outlined in the report should mature.

The report does not consider the case of a combined gas and electricity distribution station from which gas is sold outside, though this is in some respects a still more favourable proposition.

Regarding the use of gas engines, the Committee states that it would at the present time be entirely

impracticable and uneconomical to employ gas engines for power stations of the size necessary for the competitive operation of nitrogen fixation processes under British conditions. For small blocks of power the position is much more favourable both as regards capital cost and operating costs, the latter being as low as, or even lower than, the corresponding cost for steam engine plant.

These considerations have an important bearing upon one aspect of the nitrogen problem to which the Committee has devoted much attention—namely, the possibility of utilising peat as a source of power and fixed nitrogen by gasifying the material under ammonia recovery conditions and using the surplus gas as fuel for a gas-engine electric station. The crux of the problem lies in the possibility of excavating and drying raw peat in large quantities throughout the year under varying climatic conditions at a cost which will permit of the economic use of the resulting low grade peat fuel. Plants abroad, where the climate is more favourable than in Great Britain, are operated with fair success, for the peat bogs are drier than in our country and the peat has a high nitrogen content, but artificial drying has to be employed for large plants.

The difficulties to be faced may perhaps best be realised by considering the following facts. Raw peat in the bog contains only about 15 per cent. of solid material, the remaining 85 per cent. being water. For every kw.-year produced by a steam-turbo station of 5000 kw. capacity using gas-fired boilers, the gas being derived from the peat, 25·7 tons of theoretically dry peat is required, or the equivalent of 171 tons of the raw peat. If the gas is used in gas engines, the exhaust from which is used to raise steam, then only 10·8 tons of dry peat, or 72 tons of raw peat, is needed per kw.-year. Even when using gas engines this means that the 5000 kw. station will, with 100 per cent. load factor, require 360,000 tons of raw peat per annum and the quantity is more than doubled if a steam-turbo plant is used.

If the peat fuel is fed into the producers with a moisture content of 35 per cent., then 132 tons of water has to be dried out of the peat prior to its use in the producers for every kw.-year distributed from the station when using steam plant; or 55 tons of water must be dried out when using gas engines. Still in spite of these formidable difficulties there is a promising future in isolated cases where coal is expensive, and a much wider field would be opened if mechanical means of removing water from peat, to a much lower limit than is now attainable, were invented.

In concluding this review of the report a few of the other important observations and conclusions of the Committee may be given in the Committee's own words:—

"Two years' expenditure upon imported raw materials at war prices would alone more than cover the estimated pre-war capital outlay for synthetic installations capable of furnishing the same output.

"Very serious risks are involved in relying upon overseas shipments of raw materials.

"Imperial defence is too vital a matter to be subordinated to other considerations, but a wise policy in regard to defence could to a very large extent be made a sound economic policy.

"The conclusion seems evident that considerations of national safety, of finance, and of utility would force a country to resort to the policy of adopting synthetic methods as an insurance against future emergencies, instead of placing reliance on the importation of the Chilean nitrate.

"The diversion of a large portion of fixed nitrogen to munitions for a period of several years has been to the great detriment of the world's food supply.

"The food problem has become the most important consideration for all the belligerents."

The recommendations of the Committee include minimum provisions for safeguarding the future *e.g.*, the establishment of the cyanamide process on a scale sufficient to produce 60,000 tons of cyanamide yearly, of the synthetic ammonia process to furnish 10,000 tons of ammonia, and of the ammonia oxidation process to provide annually 10,000 tons of 95 per cent. nitric acid; but these, and also the more detailed conclusions at the end of each section of the report, should be read in full.

The cry of "Wake up, England" is needed to ensure that not one of the Committee's conclusions goes unheeded, and to what body of influential men can they appeal to in greater force than to the habitual readers of this Journal?

In this article only the broad facts have been touched upon, but the report is so full of interesting data, especially on the economics of the subject, as to make it in effect the most modern text-book on nitrogen fixation. No technical man can afford to be without a copy for his own reference, for the data it contains have never before been collected. Most earnestly it is hoped that this treatise, for it is nothing short of this, on nitrogen products, will be officially revised from time to time and kept up to date so that it may remain, what it is to-day, *the* work of reference on the subject.

REPORTS ON PROGRESS IN CHEMICAL INDUSTRY IN 1919.*

THE GAS INDUSTRY.

Whilst the gas industry has played an all-important *rôle* in aiding the nation to carry out its main responsibility during the years of war, it has itself suffered by virtue of the shortage of raw material and men; not only has progress been greatly retarded, but even the maintenance and renewal of plant and apparatus have been markedly inadequate. Signs are evident that the lines on which reconstruction in the gas industry is to be carried out are fundamentally sound, but many difficulties are encountered in carrying into effect such schemes of reorganisation, and to these the labour question and the shortage of material are in no way unimportant contributors.

The question of primary importance to the gas industry at the present moment relates to the nature of the gas which, in the best interests of the consumer and manufacturer, should be distributed. This is an intricate and involved problem and one on which there is naturally a diversity of opinion. The experimental work recently undertaken at the University of Leeds at the instigation of the Institution of Gas Engineers affords some useful evidence towards the elucidation of the problem, and particularly valuable is the general conclusion arrived at from these investigations, namely, that the value of the gas to the consumer is approximately proportional to its calorific value. Following the enunciation of this principle, one of the London gas companies published a scheme showing that gas could be sold upon a calorific basis, rather than by volume. Shortly following this proposal, important and, indeed, almost revolutionary proposals were made in a report issued by the Fuel Research Board. Whilst the main recommendation of this report related to the sale of

* Continued from p. 4 B of the last issue.

gas upon the basis of its calorific value, recommendations were made to the effect that a gas undertaking, subject to certain stipulations, should be free to deliver to its consumers any mixture of combustible gases free from sulphuretted hydrogen, and not containing more than 20 per cent. of inert constituents for two years, not more than 18 per cent. for the succeeding two years, and not more than 15 per cent. thereafter. It was proposed also that under normal conditions a gas undertaking should supply gas in any main or service pipe of over 2 in. diameter at a pressure of not less than 2 in. of water.

These proposals have received the approval and support of the main representatives of the gas industry.

An important contribution has been made by Sir Dugald Clerk, in collaboration with Professors Smithells and Cobb, which presents a careful and comprehensive analysis of the thermal efficiency of the carbonisation process, and in this interesting paper comparisons have been drawn between the efficiency of the coal carbonisation process and of other methods of producing light, heat, or power. In the majority of cases these comparisons are distinctly in favour of the gas industry. Emphasis is also placed upon the value of the chemical by-products obtainable from the gas industry and their value from a national standpoint.

Additional information on the steaming of vertical retorts has been furnished by various workers. The Gas Investigation Committee of the Institution of Gas Engineers reported on the conditions and yields under this system at Uddingston and found that in general practice a yield of 30,000 cub. ft. of gas of 385–394 B.Th.U's. per ton of the particular coal carbonised was obtained, together with increased yields of tar and ammonia. Other results obtained under this system of carbonisation have been reported, and the economic value of the process has also received attention.

Important work has been carried out in studying the effect of inert constituents of the gas upon efficiency during combustion, and generally the work of investigation in the gas industry bears directly upon the question of the nature of the gas to be manufactured in the future.

The work of reorganising the financial basis of the gas industry is over-delayed, and during the year directors and administrative staffs of gas undertakings have been largely concerned with these matters.

IRON AND STEEL.

The past year has been typically a period of transition from the manufacture of the greatest possible quantities of material for the purposes of war to the ultimate manufacture of the materials required for peace times, and the consequent irritability of the human being has produced disagreements in number and severity that have overshadowed technical difficulties. The general uncertainties have accelerated the tendency to establish large self-contained units that can produce within themselves as nearly as possible everything required to complete the finished articles ready for sale to the user. Several examples in Great Britain could be cited, and probably some of the most interesting features of the time are the present developments of the Tata Iron and Steel Co. in India, and the planning of the State Iron and Steel Works in Australia.

Basic steel has been put recently to progressively diverse uses. The total quantity made in the United Kingdom has increased by about 2,000,000 tons, derived almost entirely from British ores. During the war it was found safe to make high-explosive shell from basic instead of acid steel, and also gradually to increase the permissible contents of sulphur and phosphorus from 0·04 to 0·08 per cent. respectively. The necessities of this type of work impressed on all concerned the great need for care in the making of the steel ingot. As flaws in the ingot gave trouble to the user right down to such material as the finest of wire, it is to be hoped that this lesson will not soon be forgotten.

War-time secret and confidential work is gradually being revealed, and one of the most important papers on special steels recently published is that on nickel-chromium steels by J. H. S. Dickenson. He deals with the highly controversial subject of the tests that may be relied upon to prove brittleness in steel, and strongly favours the notched-bar shock test. He shows how by the heat-treatment of special steels high elastic limit and toughness may be obtained, and discusses in detail temper brittleness, which when developed by cooling in air after tempering can be avoided by quenching after tempering. The real cause of temper brittleness has not yet been made clear.

Dr. W. H. Hatfield, in a paper on the mechanical properties of steel, which evoked a great amount of discussion, considers that there is a tendency to give too much weight to the notched-bar test in judging of the possible brittleness of steel in use.

During the war there has been a curious combination of secrecy and unusual publicity; on the one hand results of work on newly-developed needs were kept from the enemy, but spread abroad among the Allies; and on the other, those firms that had made great successes in their special lines not only pooled their information, but taught their practice to outside firms. Such intercommunication, together with the general difficulties brought about by greatly increased production costs, gave a further impetus to the development of systematic research work in factories. Noteworthy events in this connexion are the recent opening of a research laboratory at Messrs. Bruntons' works and the really good progress achieved by the American Malleable Castings Association.

Alloy steels are being used more and more, and the high chromium type known as "stainless" will undoubtedly be much extended in use now that the embargo on its manufacture has been withdrawn, the whole supplies of chromium no longer being needed for war work. Alterations in the composition of alloy steels are represented by two new patents of Sir Robert Hadfield on his manganese steel. The position with reference to the employment of electric furnaces in steel smelting is being very carefully re-examined. The success in prospecting for Indian iron ores, and the movement to establish two if not three new steel plants in India, besides the gradual expansion of the Tata plant to an output capacity of three-quarters to one million tons of ingots per annum, have all attracted attention. During 1918–19 the difficulties attending the use of Indian refractories were completely overcome, thus marking a very distinct advance. The discoveries of the manganese ores in West Africa seem of great importance. Calcium carbide was evidently tried by the enemy during the war as a partial substitute for manganese, but did not prove satisfactory. The viscosity of blast-furnace slags and the mineral constitution of open-hearth slags have been studied in relation to the general question of the influence of slag on the metal produced. The patent for the Miris Steel process of quenching ingots in a liquid so soon as they can be handled has been published, and extensive experiments are being made with the process. Mr. Humfrey has developed on the lines of Dr. Sorby's "nature" prints a method of showing clearly the structure of an ingot. A number of studies of the metal of electric and oxy-acetylene welds has been made. It is claimed that the existence of two distinct eutectics has been proved, the austenite-graphite at 1153° and the austenite-cementite at 1144° C.

NON-FERROUS METALLURGY.

Although progress reported in non-ferrous metallurgy during the year shows several points of interest, technical matters have been perhaps somewhat overshadowed by economic considerations. The year began with large reserves of metals under the control of the Allied Governments, but later, under the influence of a greatly increased demand, accentuated by labour troubles, lack of fuel and difficulty of transport, an actual scarcity occurred, especially in lead, which was soon reflected in market prices.

While this country is in a more fortunate position than most others, in view of the vast resources of the Empire, it is disappointing that the hope of increasing home production is so far from being realised that in some cases our smelter production is actually considerably less than before the war.

With regard to progress of a general nature, flotation processes of ore concentration continue to show notable advances. Oxidised copper ores are now treated with some success, and it is said that a selective agent has been discovered enabling the flotation process to be applied commercially to tin ores. The Cottrell electrostatic method of fume and dust precipitation, first developed to mitigate objectionable and damaging fumes, continues to find extended applications, not only in the recovery of valuable by-products, but as an essential portion of process plants.

Of the base metals, judging from the amount of space occupied in the technical press, the metallurgy of zinc is receiving most attention at the hands of technical workers, more especially in connexion with the hydro-metallurgical and electrolytic treatment of ores. The fact that success in the electrolytic deposition of zinc depends so largely upon the purity of the electrolyte is reflected in many articles and patents on the subject, and much careful work in regard to detail has been published. Prof. C. H. Fulton has continued his researches relative to thermo-electric methods of distillation and has described a series of experiments in a novel type of resistance furnace wherein briquettes, composed of a mixture of roasted zinc ore and coke, are so arranged as to constitute part of an electric circuit and are heated by an electric current to such a degree as to distil the zinc. The large organisations owning deposits of complex zinc-lead ores (notably the Burma Corporation) are experimenting with a view to obtaining higher recoveries of the metallic values than is possible even with the methods now available. Two processes—the Ganelin-Queneau and the Elmore—have been specially referred to, but no authoritative descriptions have yet been published, and, with the exception of the earlier patent specifications, information is limited to the meagre references in the companies' reports to the shareholders.

In the copper smelting industry, pulverised coal fuel has long been successfully used in reverberatory furnaces, and it is now being tried as a substitute for coke in blast furnace practice. Leaching processes provide a mass of reading matter in the technical press, and keen interest continues to be shown generally in connexion with the treatment of low-grade oxidised copper ores, which exist in enormous quantities in many parts of the world. Nothing very new has been reported, but a continual regard to detail has increased the efficiency of existing plants and methods.

The new hard lead alloy, composed of lead and small amounts of calcium and barium, and known under the name of "Ulco," is receiving considerable attention. Originally designed as a substitute for antimonial lead in the manufacture of shrapnel, it is claimed that the alloy will take its place among the important bearing metals in view of its high melting point, excellent structure, and low coefficient of friction.

The physical properties of the metals and alloys is beyond the scope of the present report, but attention should be drawn to the excellent work of British investigators in the field of original research, most of which appears reported in the pages of the *Journal of the Institute of Metals*. Special mention may be made of the report of G. S. Bengough and O. F. Hudson to the Corrosion Committee giving the results of their investigations into the actions which take place when metals such as zinc, copper, aluminium, and alloys, such as 70:30 brass, corrode in distilled water and sea water.

SUGAR.

Generally speaking, the manufacture of sugar from the cane is now carried on with a high degree of efficiency. In several countries local experiment stations have been established for the investigation of problems concerned with the agriculture of the cane and the process of extraction, and by the staff of these institutions (as well as by others) a considerable amount of useful work is being done.

During the period under review, the operation of expressing the juice from the cane by mills has been further improved, and in Hawaii it has now been found possible by the adoption of certain modifications to realise an extraction of sucrose in the juice of no less than 98 per cent. of that originally present in the raw material. Sources of loss at different stages of manufacture have been investigated by means of a careful system of chemical control, and the result is that in many factories the recovery of commercial sugar from the juice has reached a high figure.

Contributions have been made in regard to the colouring matters present in the cane which pass into the juice, as well as those which form during the operations of clarification and heating, and from the point of view of white sugar manufacture these are naturally of considerable importance.

In the refining of raw sugar animal charcoal has been in general use for the past 100 years. It is of some interest to draw attention to the application of other forms of decolorising carbon as an alternative medium for the adsorption of colouring matters (and other impurities) from solutions of raw sugar. It is possible to record that methods depending upon the use of decolorising carbon are now in routine practice in certain factories for the production of refined sugar. Some work has also been done during the past year in indicating the comparative value of different methods that have been proposed for the preparation of these special carbons.

There can be little doubt that, while some manufacturers of raw sugar produce excellent grades for refining, others appear to operate without sufficient care and without always bearing in mind the requirements of the purchasers of their wares. In the Annual Report attention is drawn to the most desirable qualities that a raw sugar should possess from the point of view of the refiner. A criticism is made of certain practices in manufacture that render the work of the refiner of the raw sugar *unnecessarily* difficult, and suggestions for the avoidance of such irregularities are indicated.

Raw sugar during storage may undergo deterioration as the result of the action of certain micro-organisms, considerable financial loss sometimes being occasioned in this way. Recent investigations have revealed the conditions that should be observed in order to establish the best conditions for the avoidance of such changes in the quality of the product. The nature of the micro-organisms effecting the alteration under consideration has also been the subject of study.

Some progress has been made during 1919 in the direction of founding the beet-sugar industry in

this country. The industry on the Continent has greatly suffered as the result of the war, and, in consequence, there is little progress to record in this direction. Nevertheless, a few papers worthy of attention have appeared.

FERMENTATION INDUSTRIES.

Details of fermentation processes which have been used on a manufacturing scale during the war have lately come to light, and interest in the year's work is centred chiefly on these publications. A conference on the recent developments in the fermentation industries was held at the annual general meeting of the Society. The manufacture of acetone by Fernbach's process was discussed at length. The process was used successfully during the war, but at the present time acetone can be made more cheaply by the destructive distillation of wood. At the same meeting the establishment of a national institute of industrial micro-biology was recommended. Small quantities of glycerin are found when sugars are fermented by yeast. The yield can be much increased if the fermentation is carried out in slightly alkaline solutions, and during the war the Germans obtained on a manufacturing scale 20—25 per cent. of the sugar as glycerin by fermenting in presence of sodium sulphite, the glycerin being used for making explosives and for other purposes.

Various investigators have described methods of obtaining alcohol from such sources as horse-chestnuts, marine algæ, Iceland moss, vegetable ivory, etc. The report on "Power Alcohol" points out that sun-dried flowers of the mahua tree contain about 60 per cent. by weight of sugar, which can undergo alcoholic fermentation. This report also considers the production of alcohol from ethylene derived from coal or coke-oven gases. Distilleries and the vinegar industry may eventually have to face competition from a synthetic alcohol manufactured in this way.

The food accessory factor known as the anti-neuritic "vitamine," or "water soluble B," occurs in yeast and in preparations from yeast. Such preparations have been of much use during the war. It is interesting to note that over a gram of yeast is consumed daily per head of population in this country in the form of baker's yeast in bread. This yeast is not likely to have lost its anti-neuritic properties during baking, and the statement that white bread is deficient in this unknown principle seems to require modification. The whole question of "vitamines" is being vigorously attacked at the present time, as the recent report on the subject shows.

Papers dealing with the saline constituents of brewing waters have appeared. The matter is discussed mainly with reference to the effect these constituents have on the hydrogen ion concentration of worts and beers. American investigators show that the most favourable acidity for diastatic action is $P_H = 4{\cdot}4—4{\cdot}5$ for malt amylase and 4·8 for the enzyme in *Aspergillus oryzae*. The figures are of interest, for an aqueous solution of carbon dioxide shows an acidity closely approximating to these figures. The action of diastase on starch is accelerated if yeast is present, and possibly the production of a favourable acidity due to the formation of carbon dioxide is the only cause of this accelerating influence.

Other methods used by the physical chemist can be employed to solve certain fermentation problems. The importance of some velocity constants has been emphasised, and these constants have been used as a basis on which to build up an explanation of yeast growth and fermentation by living yeast. The maladies of low gravity beers have forced their attention on many investigators, especially in Germany. Discoloration, unpleasant flavours, cloudiness, and other undesirable characteristics have been observed.

The idea that acetaldehyde plays a part as an intermediate compound in alcoholic fermentation has received further support, and the use of a sulphite as a "fixing agent" for aldehydes has been further extended. Aldehyde appears to be an intermediate compound in other fermentation reactions.

Some detailed analyses by A. R. Ling of barleys and malts derived from them have been published. The results are of interest, as very few analyses of this kind are on record.

RUBBER.

The literature on rubber has been concerned generally with the examination of more or less fundamental principles rather than with any investigation or discovery of a startling nature. Much of the work, however, is of importance, and is significant of the desire to eliminate empiricism as completely as possible from technical practice. Considering the unsettled condition of the period it is perhaps not unnatural that much of the work is of a distinctly practical type, emanating chiefly from the factory and the plantation.

A remarkable feature of the work is its wide scope and general nature. As an interesting example of plantation work which could not well have been done elsewhere may be quoted that of O. de Vries on the specific gravity of Hevea latex, which S. Whitby's subsequent research on the latex yield and rubber production of individual trees serves to complement. On the manufacturing side papers have dealt with such diverse topics as the methods for introducing mineral and other ingredients into rubber, more modern rubber fillers such as glue and amorphous carbon, the catalytic speeding up of the hot vulcanisation process, the relative efficiency of organic and the commoner mineral catalysts, and S. J. Peachey's new method of cold vulcanisation with sulphur dioxide and hydrogen sulphide. Other investigations worthy of note are those by E. Beckmann and his collaborators, and by A. M. Kellas on the composition of molten sulphur at vulcanising temperatures, and also the interesting physico-chemical investigation of G. Bruni and M. Amadori as to the actual condition of so-called "free" sulphur in sulphur chloride; these are of considerable significance with respect to vulcanisation by the hot and cold methods respectively.

It is somewhat surprising to note what a large proportion of the year's work may be regarded as directly concerned with the molecular condition of rubber, an unsolved problem of which previous partial elucidations, even the investigations of C. D. Harries, serve chiefly to emphasise the magnitude. The information which has become available during the year as to the limited success experienced in Germany with synthetic rubber, clearly indicates the unsatisfactory state of knowledge in this direction, because it is not possible to make any definite decision as to the molecular state of the synthetic product or of the natural rubber which it is intended to reproduce, although the difference in this respect probably accounts largely for the shortcomings of synthetic rubber. The gradual alteration in physical properties, or the "ageing" of vulcanised rubber, involving change in tensile strength, extensibility and solubility, which has received further attention during 1919 from O. de Vries, B. J. Eaton and F. W. F. Day, and H. P. Stevens, is also presumably bound up in some modification of the molecular condition; the importance of the problem is evident. In all likelihood also to be referred to the same prime cause is the difference observable even between different lots of rubber of similar origin, such as Hevea rubber, in the relation exhibited between increasing load and the corresponding increase in elongation; this relation, de-

fined by P. Schidrowitz and H. A. Goldsbrough as the "slope" or "type" of the rubber, calls for particular attention in view of their recently elaborated method for giving mathematical expression to the characteristic latter portion of the stress-strain curve for vulcanised rubber.

Probably mainly as the outcome of war-time experiments various reports have been published as to the rate and measurement of the diffusion of hydrogen through rubbered fabrics; these, together with the recently published experiments of Sir J. Dewar, have necessitated a brief review of the position with respect to the diffusion of gases through rubber films. For this review, and also for others dealing with less extensive investigations in various directions, the reader must be referred to the Annual Report on the subject.

LEATHER.

Scientific work in connexion with the leather industry has been small in quantity during 1919, and no outstanding discoveries have been made. In actual works practice there is a steady and increasing effort to utilise machinery in every possible way. Many tanners are now using mechanical methods of liming for unhairing in place of the slower process that has been used for hundreds of years. In the actual tanning of hides there is the same tendency, as is readily seen from a survey of recent patents.

There is no slackening in the efforts to establish firmly the chrome tanning industry, and it is generally recognised that the chemist must here play a large part if permanent success is to be attained. In the leather industry as a whole the value of technological training is now admitted. The proofs of this are the overflowing state of the two leather industries' schools in this country, and the support given to conferences of tanners and technical chemists.

Artificial tanning materials have not been conspicuous in the patent literature, but are very widely used. It remains to be seen what will be the effect of more normal supplies of vegetable materials, which have been so difficult to obtain during the war. Cultivation and systematic investigation of natural supplies are now much in evidence, particularly in the British Empire, and the old wasteful methods of production will not, it is hoped, endure for long.

A very interesting paper on leather manufacture by Cross, Greenwood, and Lamb dealt with a principle which appears to the writer to be of far-reaching practical importance, namely, the principle of restrained tannage. A colloid, such as gum-tragasol, having affinity for tannin, but to a less extent than has hide, is mixed with the tanning liquor before introducing the hide. The effect is to render possible the use of very strong liquors without the usual difficulties of drawn grain and case-hardening. The speed of tannage is very greatly increased. The principle appears to be embodied in the patented process of Turnbull and Carmichael, in which starch is the colloid used.

The most important analytical work has been that carried out by committees, particularly in America, on leather, sulphonated oils, fat extraction, etc. Most of this has been on the testing, comparison, and standardisation of methods already in use. Work has been published indicating the desirability of reopening the question of tannin analysis, in the light of advances in colloid chemistry since 1907, when the present official methods were fixed. A most important fact, brought to light by Wilson, is that electrolyte non-tannins (*e.g.* sodium sulphate) are not taken up by hide powder in the proportion in which they are present in solution, and thus invariably give rise to errors.

The synthesis of gallotannic acid (the tannin of oak galls) is now an accomplished fact. When Fischer began his work on this substance some ten years ago its constitution was not known, although chemists had worked on it for over a century. Fischer's demonstration that gallotannic acid was pentadigalloylglucose, and his final achievement of its synthesis will rank amongst his best work. It is good to notice that others are continuing in this field. The puzzling influence of neutral salts of strong acids on basic chrome liquors, chromic chloride solutions, and dilute acids is being worked upon by Baldwin, and is also the subject of a recent paper by McBain. The enhanced acidity produced is of great importance in chrome leather manufacture, and a sound explanation is much to be desired. Loeb's recent work on the behaviour of gelatin at its iso-electric point is of great interest, though carried out from the biochemical standpoint.

NEWS FROM THE SECTIONS.

MANCHESTER.

At the fourth meeting of the session, held on January 9, Mr. John Allan presiding, Mr. Harold Moore read a paper on "A New Instrument for Measuring Vapour Tension." There was a large attendance of members.

The determination of the volatility of motor spirits by the process of fractional distillation does not constitute a direct measurement of volatility, and is therefore only indirectly indicative of the behaviour of the spirit in the engine. In the jet carburetter of the present day the fuel is sprayed into the induction system and drawn into the cylinder partly in the state of gas-air mixture and partly in the form of a fine mist. The portion not in the gaseous state may be gasified by the heat of the cylinder if the engine has been running, and also by the heat of compression. The ratio between the amounts of fuel in the liquid and in the gaseous state determines the ease of starting under standard conditions, and also the "flexibility" of the engine whilst running at various loads and speeds. The proportion volatilised depends upon the vapour tension, a knowledge of which is essential in the evaluation of motor spirits.

The author's instrument for determining the vapour tension of motor spirits and motor spirit mixtures consists of two tubes, of about 5 mm. bore and about 800 mm. long, connected to each other and to a levelling bottle containing mercury, by means of a Y-piece and thick-walled rubber tubing. Both tubes are clamped vertically and possess mercury-sealed cocks at their upper ends, and one is surrounded by a water jacket containing a thermometer, so that its temperature can be regulated. When the levelling bottle is raised and the cocks opened, mercury fills the tubes, and on closing the cocks and lowering the levelling bottle two barometric columns are formed.

To make a determination the cup on the jacketed tube is filled with motor spirit and a small measured amount passed into the tube, sufficient mercury being then placed in the cup to ensure an effective seal. The levelling bottle is lowered, and the difference in height of the mercury in the two limbs observed. This measures the vapour pressure of the spirit. In accurate work it is necessary to make a correction for the density of the mercury.

The laws governing vapour tensions of mixed substances are somewhat complex, and a mixture of two soluble substances may have a vapour tension either lower or greater than that of either constituent, or which may even approach the sum of

the individual vapour tensions. Cases in which the latter phenomenon is shown are of extreme importance to the student of motor fuels, as any method of raising vapour tension is of great value. In cases where the vapour tension exceeds the required value there may be found plenty of cheap fuels which can be added to bring about the necessary reduction in volatility. Graphs showing the vapour pressures of mixtures of alcohol-benzene and alcohol-petrol at various temperatures accompanied the paper.

LIVERPOOL.

A paper was read by Major F. E. Everington on "Limes and Some Other West Indian Products," at the meeting held on January 16. After reviewing the importance of the lime as a source of citric acid, and pointing out that by far the greater quantity of the acid used in this country was prepared in Germany, the author emphasised the value of the West Indies for growing limes and the need of manufacturing the acid from the juice in this country. He then described the cultivation of the lime, the preparation of the lime oil, both by milling by hand and by machinery, and the manufacture of the concentrated juice and of calcium citrate. The lecturer then dealt with the cultivation of cassava and the details of the preparation of starch, tapioca, dextrin, and glucose from its roots, as well as the utilisation of the waste products as food for animals. The value of cassava as a source of starch in comparison with the potato was shown by crop statistics and analyses of the starch contents of the two materials, cassava being markedly superior. Brief references were also made to cocoa, vanilla and some other products.

EDINBURGH.

An informal meeting was held on January 13, with Dr. D. S. Jerdan in the chair.

The meeting opened with a discussion on several points regarding the progress of the Society which had been raised by the President and Dr. Longstaff during a recent visit to Edinburgh, and various means were discussed by which the popularity of the meetings and the membership of the Section might be increased.

Mr. B. D. W. Luff then read a note on "The Solubility of Nitro-cellulose in Methyl Alcohol" which showed that the solubility was not due to the presence of acetone as is commonly supposed, but that nitro-cellulose would dissolve in the pure alcohol.

Mr. B. D. Porritt read a paper on "The Action of Halogens on Rubber," dealing with the matter in the first instance from the historical standpoint. The action of halogens on raw and vulcanised rubber was then considered in detail, and also the possibility of using the formation of the tetrabromide as a means of estimating the amount of rubber in crude samples. The method, however, is rendered inaccurate by the presence of other organic products in the rubber which may take part in the reaction with chlorine. In vulcanised rubber the presence of from 2 to 3·5 per cent. of combined sulphur introduces some uncertainty as to the accurate figure for the bromine content of the fully saturated caoutchouc tetrabromide. Mr. Porritt also gave a description of the attempts which have recently been made to make a lacquer for substances exposed to acids, alkalis and chlorine, and similar corrosive influences, by the action of chlorine on rubber dissolved in some solvent such as carbon tetrachloride.

Dr. A. C. Cumming read a note on "The Manufacture of Potassium Iodide," dealing especially with the reasons for the discoloration of the salt so frequently observed.

Mr. D. B. Dott read a note on "An Acid Sulphate of Strychnine," and showed that the acid salt on re-crystallisation from water loses acid and gradually becomes converted into the normal salt. He drew attention to the danger in the case of such a powerful drug as strychnine of the use of a salt of variable composition, and expressed the opinion that on account of its greater solubility and neutrality the normal salt only should be used in medicine.

There was a good attendance of members, and an interesting discussion followed the reading of the papers.

MEETINGS OF OTHER SOCIETIES.

FARADAY, ROYAL MICROSCOPICAL, OPTICAL AND PHOTOMICROGRAPHIC SOCIETIES.

A joint meeting of the Faraday Society, the Royal Microscopical Society, the Optical Society and the Photomicrographic Society was held on the 14th inst. at the rooms of the Royal Society. The meeting consisted of two parts: an exhibition of microscopes and accessories, and a series of papers on microscopy.

Amongst the exhibits was a new form of illuminator for opaque specimens, consisting of an annular electric lamp which surrounds the objective. It is claimed that many objects, particularly in metallographic work, are shown much more clearly by this type of illumination than by the ordinary vertical or normal illumination. The exhibits also included many forms of microscopes, both for visual and photographic work, and a number of different forms of illumination, including small oil, acetylene, gas and electric lamps. Various filters, lenses, etc., were also shown. Although only indirectly connected with microscopy, mention must be made of the crystal models exhibited by Miss Nina Hoselli. These very beautiful models are arranged to show the various development of crystal forms round the different axes of symmetry, and are made of coloured threads stretched across wire supports and mounted in glass cases, the latter representing one of the possible crystal forms.

Microscopists have been divided into "Brass and Glass Men" and "Bug and Slug Men," and the division was apparent in the papers which were read at the meeting, though in many cases, more particularly perhaps in the papers emanating from the metallurgists, there was a decided tendency to bridge the gap between the two classes, as, for example, in the excellent contributions by Prof. Desch and by Dr. Rosenhain on the metallurgical microscope, and by Dr. Willows on the microscopic outfit of a textile research laboratory.

There appeared to be a substantial unanimity, both among the authors of papers and the members who took part in the discussions, that for photomicrography the best source of illumination either was, or would shortly be, a tungsten arc, or Pointolite lamp. As at present made, the lamp is hardly powerful enough for use with high magnifications, but larger types—up to 4000 candle power—have recently been put on the market. For low powers the half-watt cone filament lamp, as manufactured for motor-car head lights, has proved satisfactory.

A considerable amount of divergence of opinion was expressed as to whether the apochromat lens was necessary for the highest quality work in metallurgical photomicrography. Some workers considered that the flatter field given by a good achromat more than compensated for the less good colour correction of the latter type, the bad effects of which could be eliminated by the use of a suitable

light filter. The majority of the speakers, however, appeared to be decidedly of the opinion that better results were obtainable by the use of apochromatic objectives.

The question of magnification was much discussed, many speakers emphasising the fact that resolution was of far greater importance than mere magnification, which indeed would be harmful if carried too far. In this connexion reference may be made to the photographs in the paper by Sir Robert Hadfield and Mr. Elliott, some of which were magnified 5000, and one 8000 diameters. A paper on the work of Sorby, and a general review of the subject, particularly from the metallographic point of view, were contributed by Sir Robert Hadfield, president of the Faraday Society; a general survey of microscopy by Mr. J. E. Barnard, president of the Royal Microscopical Society, and a paper on the history and design of photomicrographic apparatus by Mr. Duncan, president of the Photomicrographic Society, were also read.

THE CERAMIC SOCIETY.

At the monthly meeting on January 12, discussion took place on "Unestimated Losses in Pottery Manufacture." Dr. J. W. Mellor opened with some remarks on what he termed "Works Blindness," which he characterised as a kind of disease attended by the blunting of the observational powers due to constant association with a particular works or process. One instance quoted had reference to the appearance of ferruginous specks in ware produced at a certain factory where the condition of the stores department for raw materials was regarded with special pride. On visiting the store-room, Dr. Mellor promptly perceived the presence of a rusty iron bracket in a prominent position, and also a rusty gas pipe running round the room. No doubt the managers and foremen, if they had visited another works, would have noticed anything of the kind at once.

Mr. A. Fielding stated that many unestimated losses were taking place from want of attention to details, from carelessness, from want of adequate supervision, or in some cases from want of knowledge, the last being almost inevitable because of the large number of subjects which had some bearing on operations carried on in a pottery. Engines and boilers were often sources of loss through being unsuitable or not properly worked. A good stoker can save more money than the engine man, as there is no need to send out clouds of black smoke. Extravagance in the use of steam accounted for some unestimated losses, especially in the absence of records to check the working of the engine. Defective valves, etc., also give rise to losses. Another source of loss was the running off of the condensed water, instead of using it (freed, if necessary, from oily matter) for charging the boiler. The use of a jug instead of a proper oil-can for lubricating purposes wastes much material. Loss is also sustained through letting waste heat escape instead of utilising it. Other losses arise from not showing due regard for cleanliness, as in unloading clay etc. on a dirty floor, so that some of the material cannot be used.

Most (if not all) of the foregoing considerations apply to other factories as well as to potteries.

THE INSTITUTE OF METALS.—The list of forthcoming meetings issued by this Institute bears witness to the progress that is being made, for in addition to the ordinary meetings to be held in London, fixtures have been arranged in connexion with the local sections at Birmingham, Sheffield, and Scotland. The annual general meeting will be held on March 11 and 12, at the Institution of Mechanical Engineers, Storey's Gate, Westminster. The membership of the Institute is now over 1200.

THE ROYAL INSTITUTION.

The first Friday Evening Discourse of the present session was delivered on January 16 last by Sir James Dewar on "Low Temperature Studies." After remarking that the present year marks the coming of age of the Dewar vacuum vessel, the lecturer proceeded to describe an experimental method whereby the relative transparencies or diathermancies of various materials to low temperature radiation may be compared at the temperature of liquid oxygen. Liquid oxygen was shown to be highly transparent to such radiation. A thin membrane of indiarubber is similarly transparent. The physical properties of such thin indiarubber membranes at the temperature of liquid oxygen render such membranes eminently suitable for the construction of a device capable of serving as a low-temperature thermoscope. Essentially, the device consists of a number of carbon particles of linear dimensions of the order of 0·5 mm. resting upon a support of chiffon and contained within a receptacle which is closed above by a thin rubber membrane. The receptacle is connected with a delicate manometer and, when desired, a trap-door device can be lowered above the rubber membrane, effectively shutting off the carbon granules from all outside radiation. In order to secure effective thermal insulation the device is immersed in liquid oxygen contained in a vacuum vessel, the latter being surrounded by a vessel containing liquid air. The liquid oxygen must be free from particles of solid ice or carbon dioxide; if present, they are removed by lowering into it a crystal of uranium nitrate. Owing to the pressure developed in the uranium nitrate crystal, consequent upon its cooling, it becomes electrified and the ice and solid carbon dioxide crystals become attached to it and are easily removed. The inner surface of the vessel containing liquid oxygen is covered with black paper, which serves to absorb any stray radiation. When low-temperature radiation, transmitted through the superincumbent liquid oxygen, is incident upon the carbon granules, an alteration in the volume of gas occluded by the charcoal occurs, and the consequent change of pressure in the enclosure containing the granules is indicated by the manometric device, and serves as an indication of the intensity of radiation incident upon the granules. The device is capable of detecting a change of temperature of the enclosure of the order of 0·0005° C. When applied to the measurement of the relative transparencies of various media to radiation at the temperature of liquid oxygen it is found that quartz is very much less transparent to radiation at such low temperatures than at ordinary atmospheric temperature. The fourth-power law of radiation emission holds equally well for low temperature radiation as for high temperature emission.

Experiments on the transparency of rock salt in the massive, crushed and compressed forms show that when the mass is crushed, moistened with brine, and subsequently compressed, the small crystals are separated by strongly adhesive films of water which no amount of pressure can remove. The relative transparencies of various substances are indicated as follows:—Hydrogen chloride, 19·6%; sulphur dioxide, 20%; ammonia, 4%; carbon tetrachloride, 33%; carbon oxysulphide, 53%; phosphorus, 76%. The following numbers indicate the respective transparencies to low-temperature radiation of some compressed solids:—Iodine, 38%; benzoic acid, 7%; camphor, 9%. The substitution of hydrogen by nitrogen in organic substances results in the transparency of the body to low-temperature radiation being considerably reduced. Isomers can readily be detected by the method of diathermancy measurement, for in general the transparencies of isomers are markedly different.

In conclusion the lecturer deprecated very strongly the present-day demand for utility in all

activities, and entered a strong plea for the support of the scientific work of the Institution. Our world position would never be maintained if we were impelled solely by utilitarian motives. Pure science must be fostered. Scientific men must make science attractive to the world, and must themselves attract the world to it.

THE CHEMICAL SOCIETY.

On January 15 Sir J. J. Dobbie presided at an ordinary scientific meeting, when two papers relating to the constitution of coal were read by Dr. R. Lessing, the one on the behaviour of banded bituminous coal on coking, and the second on its mineral constituents. The researches were undertaken at the suggestion of Dr. Marie Stopes and Dr. R. V. Wheeler, whose work on the constitution of coal is well known to chemists (v. this J., 1918, 311 B; 1919, 452 A).

The author's experiments were carried out on samples of fusain, durain, clarain, and vitrain, isolated by Dr. Stopes from a block of South Staffordshire bituminous coal. It will be remembered that Tideswell and Wheeler submitted these constituents to slow destructive distillation *in vacuo*, raising the temperature by intervals of about 50° C. (Chem. Soc. Trans., 1919, 619; this J., 1919, 614 A). Dr. Lessing distilled similar samples rapidly in a confined space, *viz.*, in a narrow quartz tube fitted with a movable piston, and found that fusain did not form coke, that durain showed little tendency to form it, and that clarain and vitrain gave a very coherent coke (at 600° C.). Coke from durain was of a dull gray colour; that from clarain was brownish with a bronze lustre, and that from vitrain silver-gray and lustrous, like a high-class metallurgical coke. At 900° C. the differences were much more marked, particularly in regard to the appearance of a crater or mushroom-like formation on the surface of the coke from vitrain. The author expressed the opinion that the differences in coking quality were not due solely to the varying content of organic matter, and he holds that the process of coal formation was probably influenced by the nature and amount of mineral matter present, the latter perhaps acting catalytically.

In the second paper Dr. Lessing described the ash obtained by incinerating the above-mentioned coal constituents. The differences were very marked, not only in colour, but also in regard to quantity and composition. Thus fusain left 4·5—16% of ash, durain 5—7%, clarain and vitrain, 1·1—1·2%. The solubility of the ash in water and in hydrochloric acid was also investigated and found to vary widely with the different constituents. All the ashes were alkaline except that from durain, which was neutral. Quantitative examination disclosed notable differences in composition, from which the author drew some interesting speculative conclusions. Thus the very high alumina content of durain ash (42%) might be explicable on the assumption that this constituent is derived mainly from *lycopodia*, the only known plants which contain a high aluminium content; and this inference is supported by the observation that under the microscope durain is seen to contain a great many spores in the plant matrix. It was found, however, that the ratio Al_2O_3:SiO_2 in durain and fusain tallies with that in clay substance (0·85), rather than with the average ratio in the ash from *lycopodia* (2·92), but the ratios for clarain and vitrain come close to the latter. Similarly, the high magnesium content of clarain may be associated with the (unique) presence of leaf-tissue substance, magnesium being a constituent of chlorophyll.

A good discussion followed, in which Dr. M. Stopes (who exhibited microscopic slides of the coal constituents and also remarked upon the very great differences in their water content), Dr. H. G. Colman, Dr. Alex. Scott, Mr. A. C. Chapman, and Dr. R. H. Pickard took part.

INSTITUTION OF PETROLEUM TECHNOLOGISTS.

At the January meeting, a paper on "The Spontaneous Ignition Temperatures of Liquid Fuels" was read by Mr. Harold Moore. Sir Frederick Black, president, was in the chair.

A summary of previous investigations on this subject, which is one of the greatest interest to users of internal combustion engines, showed the need for an apparatus and technique capable of simple, rapid and accurate operation. The author had devised such an apparatus in which the fuel was dropped into a cavity in a heated steel block, the temperature of which could be controlled and determined with accuracy, a current of preheated air or oxygen being simultaneously admitted. The preliminary data published in 1917 had been augmented, and a careful study had been made of the influence of variation in the conditions employed in the test, particularly as regards the quantity of fuel and of oxygen used, the effect of dilution with carbon dioxide and the catalytic action of the material of the test cup, all these factors proving of very small moment.

The spontaneous ignition temperatures in air and in oxygen of a large number of fuels, including crude petroleums and various distillates and residuums derived from these, coal tars and distillates, shale oils, alcohol and a selection of pure organic compounds were tabulated, the most noteworthy conclusions being:—

1. Among petroleum distillates the lightest products have the highest ignition temperature.

2. The same rule holds with coal-tar products, but all aromatic compounds have ignition temperatures very considerably higher than petroleum products of corresponding boiling point. Olefinic compounds, such as cracked spirit, ignite at a lower temperature than the corresponding saturated hydrocarbons.

3. The temperature of spontaneous ignition in oxygen is usually from 100° to 170° C. lower than in air.

Some curves of great interest were shown illustrating the variation of spontaneous ignition temperature with composition in the cases of various mixtures of fuels, such as petrol-benzol and cannel oil-creosote, and demonstrating that a small amount of the component of low ignition point has a much more notable effect than a considerable proportion of the component of high ignition point.

The application of the data obtained in this research to the question of the most suitable compression-pressure for a specific fuel used in a Diesel engine and the modifying effect of variations in engine design and other influencing factors, was discussed and illustrated by curves derived from engine tests.

ASSOCIATION OF BRITISH CHEMICAL MANUFACTURERS.

Attendance of Employees at Continuation Schools.

A meeting was held recently at the offices of the Association of British Chemical Manufacturers, with Mr. W. J. U. Woolcock, M.P., in the chair, for the purpose of discussing with Sir Robert Blair, the Chief Education Officer of the London County County, a scheme for Compulsory Day Continuation Schools under the Education Act, 1919.

Sir R. Blair expounded the conditions under which the Education Department of the London County Council deemed it advisable for the con-

templated action to be taken. In view of the fact that hitherto only some 20 per cent. of ex-elementary school pupils have attended evening schools, a compulsory further education is now regarded as essential. The Act requires that after a given day (which will probably be July 31 or October 31 next) boys and girls who have attained 14 years of age shall attend compulsory day continuation schools for 8 hours a week for 40 weeks in the year, an obligation which is to apply at first only to boys and girls between 14 and 16, but after seven years from the appointed day also to those between 16 and 18.

Owing to the circumstance that boys and girls may live in one district and work in another, the problem of arranging the hours of attendance at these schools is very difficult, but Sir R. Blair suggested that two days of four hours each—either morning or afternoon—would be the best solution. The opinion of those present was that this method should be adopted. There is also an obligation on the part of the employer to allow sufficient time for the boy and girl to reach the school and to be in a fit physical condition to assimilate the instruction.

In regard to the chemical industry, Sir R. Blair suggested that it might be advisable to establish a chemical school where the pupils could not only take general education, but also receive tuition in chemistry. It is therefore necessary to ascertain the number of boys and girls, within the specified age limits, who are engaged in chemical works in London, and he asked those present to endeavour to supply this information. In answer to a question put by the speaker as to the seasonal nature of different branches of the chemical industry, the meeting gave the following information:—Tar distilling, pharmaceutical and fine chemical branches: no season, busy all the year round. Gas companies: seasonal; winter the heaviest time. Fertiliser industry: seasonal; autumn, winter, spring busy; summer slack.

As there are some 60,000 children leaving the London elementary schools yearly, provision will have to be made in continuation schools for 240,000 pupils when the Act comes into force. The problem of providing accommodation and teachers will therefore give considerable trouble to the local authorities, who are responsible for carrying out the provisions of the Act. Sir R. Blair suggested that if a firm had a sufficient number of boys and girls of the proper age in its employ, the question of providing a school room on the premises should be considered, and if the firm also had on its staff adults capable of giving the requisite teaching, the necessity of boys and girls attending separate compulsory continuation day schools could in this way be obviated. A private works school would be recognised by the authorities, provided the curriculum and the number of pupils were held to be satisfactory by the Local Education Authority.

It was very important to consider whether the boys and girls who will leave the elementary schools at the end of each term—estimated at 15,000—should be exempt from continuation schools by attending full-time schools. In response to various questions, Sir Robert Blair said that secondary and central schools would be most suitable for full-time education.

Employers appear to have the right to refuse to employ children under the age of 16.

The chairman referred to the question of the number of boys and girls employed in chemical factories in the London area, and the opinion of those present was that approximately 15 per cent. of the total number of employees would be boys and girls between 14 and 18 years of age. It was therefore estimated that provision would have to be made for 3,000 pupils engaged in the chemical industry in the London area. In the case of gas companies it was estimated that the percentage was about 10—12.

On the subject of the curriculum, Sir R. Blair said that physical education must be pursued in the first two years. Boys from 14–16 years of age would be instructed in writing, English, some English literature, history and geography; and from 16–18, in mathematics, science and some definite technical subject relating to the trade in which they were engaged.

PERSONALIA.

Prof. W. A. Noyes has been elected president of the American Chemical Society for 1920.

The death is announced of Dr. J. H. Wilson, lecturer in agriculture in the University of St. Andrews.

Dr. Edwin Deller has been elected Assistant Secretary of the Royal Society, in succession to Mr. R. Harrison.

Prof. R. Willstätter, of Munich, has accepted the chair of chemistry in the University of Berlin, vacant by the death of Emil Fischer.

Prof. W. Nernst, director of the Institute of Physical Chemistry in Berlin, has been elected a foreign member of the Swedish Academy of Sciences in Stockholm.

Mr. A. C. J. Charlier, president of the National Association of Industrial Chemists, has been re-elected president of the Federation of Technical and Scientific Associations.

The Perkin Medal awarded annually by the American Section (late New York Section) of the Society of Chemical Industry is being awarded this year to Dr. Charles F. Chandler for his work on the standardisation of kerosene.

The William H. Nichols Medal of the American Chemical Society is to be awarded to Dr. Irving H. Langmuir for his paper on "The Arrangement of Electrons in Atoms and Molecules," which has been adjudged the outstanding feature of the publications of the Society during the past year.

Dr. T. F. Sibly, professor of geology at Armstrong College, Newcastle-on-Tyne, has been appointed principal of the Swansea Technical College. This college, which has recently been affiliated to the University of Wales, has departments of chemistry, metallurgy, mathematics, physics, and engineering.

The following candidates were successful in the examinations held by the Institute of Chemistry in January, 1920:—Fellowship: G. B. Brook (Metallurgical Chemistry); F. F. Beach, M.A., B.Sc. (Food and Drugs, Fertilisers and Feeding Stuffs, Soils and, Water). Associateship: H. H. Barber, B.Sc.; L. P. McHatton, A.R.C.S., and H. C. S. de Whalley (Organic Chemistry); J. Haycock and Miss E. E. Sparling (Food and Drugs, etc.).

Colonel Sir Frederic Nathan, recently officer in control of alcohol under the Ministry of Munitions, has been appointed Power Alcohol Investigation Officer under the Fuel Research Board of the Department of Scientific and Industrial Research. The appointment is a direct consequence of a recommendation made by the Inter-departmental Committee on the Production and Utilisation of Alcohol for Power and Traction Purposes (this J., 1919, 250 R). A similar appointment is that of Prof. Pierce Purcell, formerly secretary to the Irish Peat Inquiry Committee, to act as Peat Investigation Officer under the Fuel Research Board.

NEWS AND NOTES.

CANADA.

A New Mineral Dye Industry in Ontario.—A new company, named the Mineral Dye Products, Ltd., will shortly be producing pigments at Trenton, Ontario, the mineral being derived from a property near the Rideau Canal, 18 miles from Ganonoque. It is reported that the company has perfected processes for the manufacture of high-grade mineral dyes for woollens, silks, etc., as well as for the paper industry. It will also probably manufacture paints.

Iron Ore Deposits in British Columbia.—The iron ore deposits on the coast of British Columbia are shortly to be investigated under the auspices of the Provincial and Dominion Governments. Meanwhile representatives of an English steel firm are prospecting privately and have notified the Department of Mines of British Columbia that if the deposits are found to be as stated, the firm will finance the erection of iron and steel works in the vicinity of Vancouver and build the necessary railway.—(*Official.*)

AUSTRALIA.

Reward for Oil Discovery.—Following a recent meeting of the Federal Cabinet the Prime Minister (Mr. W. M. Hughes) made the following announcement:—"The Commonwealth Government has decided to offer a reward of £10,000 for the discovery of oil in commercial quantities in Australia." Presumably this refers to free mineral oil (petroleum), which has long been sought in various parts of Australia without much of a practical nature resulting, although traces of oil have been discovered in several places.

In New South Wales oil-bearing shales have been worked to a limited extent for many years, and similar deposits are known to exist in some other of the States. The Shale Oil Bounty Act of 1917 provides for the payment of bounty on crude shale oil produced in Australia from local shale at rates ranging from 2½d. to 1½d. per gallon according to the quantity produced, the amount to be so expended by August, 1921, being limited to £67,500.

In Papua the Commonwealth Government has spent much money in putting down bores and testing likely fields. Oil is undoubtedly present, but whether in commercial quantities has yet to be proved. Arrangements have lately been made to spend a further £100,000 in boring operations, the Imperial Government finding half the money.—(*Hardware & Machinery, Nov.*, 1919.)

BRITISH INDIA.

Indigo Crop Statistics.—The area under indigo cultivation is officially estimated at 233,800 acres, the total yield at 37,100 cwts., and the average yield at 18 lb. per acre. The corresponding estimates for the previous year, 1918-19, were 296,200 acres, 43,800 cwts., and 17 lb. respectively.

Forest Research Institute.—We have pleasure in inserting the following communication received from the President of the Forest Research Institute, Dehra Dun:—There are now special opportunities of developing the forest resources of India. Both the Government of India and Provincial Governments have already taken measures to inaugurate new industries, and a special staff is being organised to deal with the commercial undertakings that have already been or are rapidly being established. Delays are inevitable in communicating with manufacturers of plant and equipment, and it is therefore proposed to open a library of catalogues and price lists in the Economic Branch of the Forest Research Institute. The Forest Economist will be pleased to receive and circulate among inquirers catalogues, etc., dealing with every branch of equipment used in forest industries. It is hoped that firms will help in establishing and maintaining this library by contributions *in duplicate* of catalogues, pamphlets, etc., as they are issued.

UNITED STATES.

Wool as Filtering Material.—Experience gained during the war in industries using magnesium chloride, tungstic acid, aluminium sulphate, Epsom and Glauber's salts, etc., shows that such materials can be filtered through woollen filter pads. These have the advantage over cotton in that they can be washed repeatedly and re-used; but, of course, they cannot be used for alkaline substances.

Horse Flesh in Human Dietary.—In his presidential address to the Association of Official Agricultural Chemists, Dr. P. F. Trowbridge discussed the economic gain which would result from the use of some two million undersized horses in the United States for food purposes, and produced a sample of dried horse flesh prepared in his laboratory which compared very favourably with the best grades of dried beef. It was the opinion of many of those who sampled both materials that the dried horse flesh prepared from an animal twelve years of age was not only more tender, but of better flavour than the best grades of dried beef. Notwithstanding such successful demonstrations, it will doubtless take many years to overcome existing prejudice against unusual foods.

Potash from Searles Lake.—Owing to the high borax content of the potash produced at Searles Lake, the Department of Agriculture has found it necessary to place restrictions on the use of potash salts containing borax, so that not more than two pounds of anhydrous borax may be applied per acre. Instructions have been issued to fertiliser manufacturers and mixers not to sell potash salts direct to farmers when they contain more than five-tenths of one per cent. of borax, nor to sell mixed fertilisers containing more than two pounds of borax per ton. If these restrictions are complied with it is thought that no danger whatever will attend the use of Searles Lake potash salts. In view of the possibilities of Searles Lake it is unfortunate that any material should have been used carrying damaging amounts of borax, as it is feared that it will be some time before the prejudice created can be overcome.
